# INDEX.

## PREFACE AND INTRODUCTION.

### AGRICULTURE:

	PAGE.
influence of railroads upon .....	CLXIV
number of horses employed in .....	CLXV
agricultural associations, societies, history of .....	XIII
agricultural products by States and Territories, for 1860 and 1860, compared with population, tables of .....	CXXIX
agricultural products, demand for, increased by manufactures in the west .....	XLII
great want in American agriculture which occupies the place of the turnip in the English system of rotation .....	LXXVII
charlatans contrasted with real benefactors in .....	IV
farmers, interests of, not promoted by government .....	III
farmers desiring government to abstain from legislation relative to .....	IV
home consumption, how increased .....	II
homestead free, by act of Congress .....	VIII
home market, attractive, popular, and honorable in .....	III
importance of, as a recourse for wealth .....	III
increase of demand stimulating husbandmen to efforts in .....	III
laws, application of, not beneficial to .....	III
laws, political effect of .....	III
prosperity of, in proportion to increase of population .....	III
policy best to pursue in .....	IV
policy, present, to promote, (loss of time and disappointment) .....	IV
relation of produce to foreign markets in .....	III
short roads to fortune avoided by people engaged in .....	IV
supply at home, foreign demand for agricultural products .....	III
saving to government by institution illustrating character of trees and plants .....	V
in the United States .....	VIII-X
implements of agriculture in use, value of table of .....	X
labor-saving appliances useful in .....	XI
labor in United States, scarcity of .....	XII
war, effect on agriculture .....	XLII
drill-husbandry, profit of, demonstrated by John Wynn Baker .....	XIII
number of patented inventions for, previous to 1848 .....	XII
mechanical inventions stimulated by high price of labor in .....	XI

### BARLEY:

produced in the United States in 1860, table of .....	LXVIII
climate better adapted to production of wheat than of .....	LXVIII
superior in England to any other country .....	LXVIII
total crop in States and Territories in 1860, of .....	LXVIII
raised in New England States in, 1860 compared with 1850 .....	LXIX
raised in Middle States in 1860, compared with 1850 .....	LXIX
raised in Western States in 1860, compared with 1850 .....	LXIX
raised in Southern States in 1860, compared with 1850 .....	LXX
raised in Pacific States in 1860, compared with 1850 .....	LXX
raised in United States in 1860 and 1850, in proportion to population .....	LXX
culture of .....	LXXI

	PAGE.
BEANS AND PEAS, produced, (see Peas and Beans) .....	LXXIV
BEESWAX .....	CVIII
BRET :	
climate of Southern and Western States favorable to growth of the .....	CI
leaves and pulp of the, used as a food for cattle .....	CI-CIV
BET ROOT :	
cultivation of, .....	CH
description of, .....	CH
analysis of, by Peligot .....	CHH
table of; cost of; culture of in France .....	CHH
statistics of, in France .....	CIV
comparison of, with cane .....	CIV
BUCKWHEAT :	
produced in States and Territories in 1860 .....	LXXI
total production of, in States and Territories, from 1840 to 1860 .....	LXXII
raised in New England States in 1860, compared with 1850 .....	LXXII
raised in Middle States in 1860, compared with 1850 .....	LXXII
raised in Western States in 1860, compared with 1850 .....	LXXIII
raised in Southern States in 1860, compared with 1850 .....	LXXIII
raised in Pacific States in 1860, compared with 1850 .....	LXXIII
United States, 1850 and 1860, in proportion to population .....	LXXIV
rapid progress of, in California .....	LXXIV
BUTTER AND CHEESE :	
produced in States and Territories in 1860 .....	LXXXII
made in New England States in 1860, compared with 1850 .....	LXXXIII
made in Middle States in 1860, compared with 1850 .....	LXXXIII
made in Western States in 1860, compared with 1850 .....	LXXXIII
made in Southern States in 1860, compared with 1850 .....	LXXXIV
made in Pacific States in 1860, compared with 1850 .....	LXXXIV
United States, in proportion to population .....	LXXXV
CALIFORNIA :	
cattle, (horned,) in .....	CLXXI
fruits, vegetables, and wool, of .....	CLXXI
sheep, (Merino,) in .....	CLXXI
sugar, (cane, Chinese,) in .....	CLXXI
wool, clip of .....	CLXXI
grain-trade of .....	CLVIII
CANALS :	
tonnage, proportion of, in 1862 .....	CLXVI
tonnage, different routes, proportion of .....	CLXVI
CATTLE :	
experience in, in Texas .....	CXXXIV
(English,) first introduction of, into the West .....	CXXXII
general interest in improvement of, first manifested in 1832-'36 .....	CXXXIII
manner of raising or breeding of .....	CXXXIII
western trade of .....	CXXIX
disease of, in this country .....	CXIX
other, (see Live-stock) .....	CXV
CHEESE AND BUTTER, (see Butter and Cheese) .....	LXXXII
CINCINNATI, shipments from, north and south, for four years .....	CLVII
for 1826, 1835, 1853, and 1860, prices of produce in .....	CLXVIII
CORN :	
raised in United States, table of .....	XLVI
production of wheat compared with .....	XLVII
production of, in principal corn-growing States in 1860, 1850, and 1840 .....	XLVII
in New England States in 1860, 1850, and 1840, together with population .....	XLVIII
in Middle States in 1860, 1850, and 1840, together with population .....	XLVIII
in Southern States in 1860, 1850, and 1840, together with population .....	XLVIII
in Western States in 1860, 1850, and 1840, together with population .....	XLIX

## CORN—Continued:

in Pacific States in 1860, 1850, and 1840, together with population.....	XLIX
rapid increase of, in California.....	L
in New England, Middle, Western, Southern, and Pacific States in 1860, 1850, and 1840, together with number of inhabitants.....	L
bushels of in different sections United States to each inhabitant, in 1860, 1850, and 1840.....	L
in United States to each inhabitant, 1860, 1850, and 1840.....	LI
culture of.....	LII

## COTTON:

amount of, United States, in 1850 and 1860.....	XCIII
table of, amount raised in different States, 1850 and 1860.....	XCIV
amount of, exported from United States in 1792.....	XXVI
bow-string operation of.....	XXVII
cotton-gins, history of. (See Implements, Agricultural).....	XXVI

## DAIRY PRODUCTS.....

LXXXIII

## DOMESTIC ANIMALS. (See Live-stock).....

CVIII, CIX

## EXPORTS OF FLOUR AND GRAIN: (see Flour and Grain:)

from United States to foreign countries for the year ending June 30, 1862, table of.....	CXXXVII, CXXXVIII
from United States to foreign countries from 1790 to 1817, table of.....	CXXXIX
from New York to foreign countries.....	CXLI
from Boston to foreign countries.....	CXLI
from Philadelphia to foreign countries.....	CXLII
from Baltimore to foreign countries.....	CXLII
from Portland to foreign countries.....	CXLII
from Montreal for three years.....	CLII
from New Orleans to foreign ports.....	CLVII
from San Francisco to foreign countries.....	CLIX
of grain, flour, and meal from Russia, 1857 to 1862, inclusive, table of.....	CXLIII
of breadstuffs compared to total domestic exports.....	CXLI

## FARMS:

under actual cultivation in United States, value of.....	XV
--	----

## FLAX:

produced in States and Territories, 1850 and 1860.....	LXXXIX
amount grown in New England States, 1860, compared with 1850.....	XC
amount grown in Middle States, 1860, compared with 1850.....	XC
amount grown in Western States, 1860, compared with 1850.....	XC
amount grown in Southern States, 1860, compared with 1850.....	XCI
amount grown in Pacific States, 1860, compared with 1850.....	XCI
in different sections in proportion to population, in 1850 and 1860.....	XCI
small crop of, owing to scarcity of labor.....	XCI
climate of Northern States adapted to growth of.....	XC
scarcity of cotton increasing culture of.....	XC
improvement in machinery for dressing fibre of.....	XC

## MANUFACTURES.

---

"In places wherein thriving *manufactories* have erected themselves, land has been observed to sell quicker, and for more years' purchase, than in other places."—LOCKE.

NATURE, in the wide dominion allotted to man, has given him the means, in some latitudes spontaneously, but everywhere through *labor*, of supporting life from the products of the soil, whilst he has been invested with the faculty of reason and invention, whereby to discover the secret agencies of the material world, and so direct them as to change its products into new forms—forms of utility, endless variety, and beauty—all ministering to the end of promoting the comfort, prosperity, and happiness of our race; and these are classed by political economists under the general name of Manufactures.

The agriculturist opens the earth, and so disposes the seed that, aided by heat, moisture, and the silent but ever active agencies of nature, he secures the reward of his diligence and skill.

The preceding volumes of the Census of 1860 indicate the population in that year of this Empire-Republic, and the agricultural products which the labor of our people, in the diversity of our soils and climate, has brought from the bosom of the earth in such abundance as not only to support thirty-one and a half millions of inhabitants in 1860, but with an immense surplus for foreign markets.

The statesman or historian, in glancing over the past seven or eight generations to the period when feeble settlements were first established on these then barbarous shores, and in an unopened wilderness, will trace the causes of our progress and advance in civilization. He will find in our Constitution and laws security to persons and property—the incentives to individual enterprise.

It has been forcibly said that the "accumulation of capital which has taken place in England during the last hundred years, and which, besides enabling that nation to defray, with little difficulty, the cost of so many protracted and destructive wars, has covered the land with cities and all sorts of improvements, and the ocean with ships, would either not have taken place at all, or but in a very subordinate degree, had there been any serious doubt about its present or future security, or about the ability of the owner to employ it, or bequeath at pleasure."

These elements of steadiness and security are found in our political system, the spirit of which is against monopolies, and favors freedom of industry and trade. Our policy is in no respect exclusive in dealing with great industrial interests; it invites competition at home and from abroad, encourages immigration, conceding to foreigners, after a limited period of residence, the privileges of a native-born citizen. It opens up to all the vast fields of the public domain, the common inheritance of our people, and presents a surface of every variety of climate and soil equal to the support of the human race, according to the ratio to a square mile of the Belgian population. From these broad acres liberal donations have been conceded for the establishment of schools, colleges—agricultural and mechanical—universities, and works of internal improvement on a stupendous scale.

We have within the bounds of the Republic the raw material for almost every branch of manufacturing industry. In veins of gold and silver are found wealth unmeasured and incalculable. These,

the universal representatives of values, predominate in *intrinsic* worth over the *labor* in any form bestowed upon them in manufacture. The Union also holds in its territory the useful metals of iron, copper, lead, and tin, of untold extent, in which *labor* constitutes the chief value, as shown in the diversified forms in which skill has fashioned these metals, from the mainspring of a watch, where the artisan's genius imparts a hundred-fold value over that of the raw material, to articles of domestic use, and from these up to the complex and gigantic machines which do the manual labor of hundreds of thousands of men. Other products, as sand and soda, of inconsiderable value in their crude state, are capable of transmutation into beautiful and useful forms, subservient to domestic use—in the adornment of temples of worship, in stained and colored glass of living hues, and in other forms of excellence and taste, embellishing palatial edifices, and giving light and comfort even to the lowly cottage; then in the form of telescopic power, whereby the eye of science watches the sidereal procession by land and sea, and realizes the value of the teachings of these celestial objects. Even rags, valueless in their crude state, the skill of the manufacturer transforms into paper, the medium of recording the doings of man in social and business life, and perpetuating, in written forms, the results of scientific, philosophic thought, the rise, progress, decline, and fall of nations, the means whereby the people, through the press, are continually in council in our own land, and the great truths of natural and revealed religion are everywhere disseminated. The man of observation sees our prosperity in the driving of the ploughshare over wide fields between the two great oceans of this half continent, and from the inland seas of the North to the Tropics; in establishing over two millions and forty-four thousand farms, and in creating cities rivalling some of the proud capitals of Europe which had been founded a thousand years ago. These, with towns and villages, number twenty-eight thousand, and contain a fraction less than five millions of houses. Our manufactories number one hundred and forty thousand four hundred, besides machine shops of great capacity and value, the former converting the raw material of wool, cotton, hemp, hair, hides, and other products, into the multitude of forms known to civilized life, the latter creating machinery of immense strength, of exact movement, huge engines of labor, moved by the irresistible force of steam, indicating the intellectual power and skill of our citizens, whilst our shops and ship-yards are continually renewing and increasing the commercial and naval tonnage. The industry of our people has linked our cities, manufactories, and machine shops by lines of railway much greater in lineal extent than the circumference of the globe, and connected by the electric telegraph the most distant points of the republic. Not content with these triumphs of manufactures and machinery, the genius of man has demanded of the earth her oily treasures, and, by powerful engines, is enriching the country by securing this valuable product, the element not merely of light, but of permanency and lustre in color in the manufacture of woollen and other fabrics.

Dr. Adam Smith, in his treatise on the "Division of Labor," states that "the most opulent nations, indeed, generally excel all their neighbors in agriculture, as well as in manufactures; but they are eminently more distinguished by their superiority in the latter than in the former."

This declaration of the great political economist is illustrated in the vast wealth brought to the British shores by manufacturing instrumentality.

In 1337, five and a quarter centuries ago, the English were nothing more than shepherds and wool-sellers. An act of Parliament in that year interdicted the exportation of wool, and the use of any but English cloth, forbidding the importation of foreign cloths, yet inviting foreign manufacturers to domicile in the country. The wonderful progress and wealth of that nation are traced from the time

## PRELIMINARY VIEWS.

of the establishment of manufactories in the kingdom, and to the use of their machinery, the aggregate capacity of which is equal to the manual labor of the whole human race.

What strides in that direction have the United States taken in the last half century!

In the year 1810, by order of the Secretary of the Treasury, the returns of marshals in relation to our manufactures were then arranged by a skilful agent. The results are, that the goods then manufactured by the loom from cotton, wool, flax, hemp, and silk, besides instruments and machinery manufactured—hats of wool and fur; manufactures of iron, gold, silver set-work, lead; of soap, tallow candles, wax, spermaceti, and whale oil; of hides, shoes; of wood, oils, refined sugars, paper, marble-stone, slate, glass, earthen manufactures, tobacco, dye-stuffs, drugs, paints, cables, and cordage—

Amounted to .....	\$127,694,602
Omitted articles, or those imperfectly returned, estimated at .....	45,068,074
To which add value of "doubtful articles," having connection with agricultural pursuits, cotton-pressing, flour and meal-mills for grinding grain, &c., estimated at .....	25,850,795
<hr/>	
Making, in the year 1810, the aggregate manufacturing values of .....	\$198,613,471
<hr/>	

What were the values of this branch of American industry in 1860? The exact figures, according to the Census tables, are \$1,885,861,676.

To this amount, obtained from actual census returns, let there be added a moderate estimate for omissions, and for non-return of minor and inconsiderable establishments, and the aggregate values, in 1860, of our manufactures, reach the enormous sum of two thousand millions of dollars, having been multiplied ten times within the fifty years ending in 1860, whilst our population in the same period has increased four and a half fold.

These amazing results, whilst measurably affected by the wealth of our soil, its successful tillage and abundant harvests, are yet directly traceable to the science, artisan-skill, industry, and energy of the American people in the great department of manufactures; results, realizing to the nation the truth hereinbefore mentioned, that the most opulent nations are more distinguished by their superiority in manufactures than in agricultural interests; and yet, in the ratio in which the former are increased, is the landed estate enhanced in value—these great interests reciprocally acting upon and advancing each other.

With unlimited raw material at hand to supply almost every variety of manufactures; with a railway system completely connecting every important point east of the Mississippi, and rapidly extending so as to carry the work to the Pacific; with a line of river and canal communication reaching the principal interior marts of the country, we have the elements and the means within ourselves of a domestic trade of surpassing value; and, with a river and ocean commerce equal to thirty thousand vessels, the United States have become a formidable competitor for the lion's share of the trade of the world.

Carnot, the war minister of France, the man who "organized victory," in resisting, in 1802, the decree creating Napoleon consul for life, spoke generally of the instability of republics, tracing the same to the fact of "being hastily put together in the midst of civil commotions, enthusiasm always presiding over their establishment." But that distinguished statesman singled out from these the American republic. "*One only*," said he, "has been the work of philosophy." *Organized in the calm of peace*, this republic subsists, full of wisdom and vigor; the *United States of North America* present the phenomenon, and their prosperity constantly receives accessions, which excite the wonder and admiration of other nations.

Thus was it reserved for the New World to teach the Old that "*nations may tranquilly exist under the dominion of liberty and equality.*"

Such was the Union at the opening of the present century, in the infancy of its political being. What has it accomplished since? It has advanced with gigantic strides towards its high destiny in the three elements of a nation's power—agriculture, manufactures, and commerce. The results are recorded in the census volumes of 1860; but it has gone further: it has successfully quelled the greatest revolt known to ancient or modern times.

The insurgents were fully prepared, having twelve millions of people, a vast territory, genial climate, and united councils. They were confident of supremacy in the art of war, and encouraged by partial successes. The national Executive, on the other hand, was stripped of almost every governmental resource except the moral power of the law and constitutional administration, and it was not until exhaustion on the one side, and the constant and rapid development of resources on the other, quickened by unfaltering patriotism, that the strength of the general government began to tell in favor of the national cause, and that even sanguine patriots hoped for success.

Without our manufacturing capacities whence could we have drawn the materials of war? Not from abroad, for there was hostility of sentiment. Who would have taken our loans? Not the capitalists of England or the Continent, for there the sympathy generally was with the other side. No, it was manufacturing and mechanical resources and the granaries of the West which enabled the republic to arm, subsist, and pay immense armies, and create iron-clad fleets to meet the emergency. It was mainly for the want of these, and not for lack of courage, will, or skill, that the revolt failed. A more striking illustration of the value and power of such resources is not to be found in history; and from it, now that the cause of discord is at an end, the integrity of the Union vindicated, and the reign of peace begun, all sections of the country, States, counties, and parishes may derive lessons of wisdom and profit in regard to the value of manufactures and the mechanic arts.

In glancing at the results incident to the development of *manufactures*, the mind naturally rises to the contemplation of other and varied relations of our people.

Covering, as our country does, the whole belt of the northern temperate zone on the continent, including within its out-boundaries an area of three and a quarter millions of square miles, equal in extent to the *arable* surface of the British empire, with all its Asiatic, Australian, American, and island possessions, and having a coast line by river, lake, and ocean of twenty-nine thousand three hundred and twenty-eight miles, our institutions are capable of and point to indefinite extension. The popular power is centralized for the security and promotion of national greatness, prosperity, and unity, whilst localized for State, municipal, and intellectual advancement, both defined and united by a common language, ancestry, history, climate, natural and artificial boundaries, with means of rapid and continual intercommunication. Ought we not, therefore, at the National Capital, now, to lay the foundation of an institution which shall annually present complete statistical information of the progress of our people in all the pursuits of life? Such an institution should also gather, into separate apartments or divisions, designated by the names of the States and Territories, a complete representation of their boundaries, subdivisions, history, progress, and advancement in the arts and sciences; their towns, cities, and villages; laws, institutions of learning; their agricultural, manufacturing, and mineral products; to the end that all who, for pleasure or business, visit the centre of political power may not only see the greatness of the nation through its public buildings, departments, and institutions, but may also see and learn as accurately of each State, its people and productions, as could otherwise be seen and learned by the most extended travel and observation.

In such an institution the representatives of the people and the members of the government could and would be educated to a better understanding and appreciation of the value of the Union, and of the vast and varied interests over which they are called to preside; and our own citizens, and immigrants from distant lands, would study our progress and learn to appreciate the extent of our country—the industry, enterprise, and intelligence of its people.

It would be the great republic in miniature, presided over by the national statistical commission, where would be aggregated annually all important facts connected with our industrial and intellectual pursuits and progress, to be disseminated through the press to the advantage of every State and each portion of the republic, and to our people individually. Here our progress in all that concerns art, science, or use could be studied in aggregate or in detail, by figures or example, and demonstrated by products and results.

It would be a perpetual national and State industrial and intellectual exhibition. It might be called the “National and State Art and Industrial Academy,” or any other appropriate name.

Such an institution may be established with little cost to the government, other than the preparation of suitable apartments and the payment of a small force of competent men to be engaged in gathering, systematizing, and publishing an *annual* statistical report of our agriculture, manufactures, and population. Information for other years than those of the decennial enumeration required by the Constitution could be obtained through the various local federal officers without cost, except for blanks, and with greater accuracy as to all taxable articles than has ever yet been obtained through the census returns. This would be published so promptly as to be available and valuable to business and public men within each year.

The contributions to the respective State divisions or departments would be promptly and freely made by States, corporations, and individuals, as it would become the best means of advertising the interests of any State, or the productions, industry, art, or learning of any individual or association throughout the country.

In the years of the decennial census the collection and arrangement of statistical tables would be on a more extended scale, and consequently involve greater expenditure than the intermediate years; but being thoroughly systematized, and directed by experienced and earnest men, the greatest possible economy would be attained, and the results promptly presented to the country, while the information was still valuable in other than a historical sense.

The census of 1860 affords a proper and suitable starting point for the proposed system, and will become of historic interest and importance, in view of the great events and changes which immediately followed its survey of the country. The facts presented by this compilation were gathered near the close of a period of long and uninterrupted domestic tranquillity, and will, when another such compilation shall be made, afford a satisfactory basis for ascertaining with reasonable accuracy the effect of this protracted and desolating war upon the material, moral, and intellectual condition of our country.

A measure like this, when adjusted and perfected by the lights of experience, would furnish materials of the highest interest to our citizens, creating emulation, commendable rivalry, operating as incentives in the progress of civilization, inspiring our people with confidence in the strength and perpetuity of our institutions, and demonstrating their complete adaptation to all the ends of good government.

J. M. EDMUNDS,

*Commissioner General Land Office, and in charge of the Census.*

WASHINGTON, D. C., August 14, 1865.

# INTRODUCTION.

## MANUFACTURES IN THE UNITED STATES.

### COTTON GOODS.

The growth of the culture and manufacture of cotton in the United States constitutes the most striking feature of the industrial history of the last fifty years.

Commencing properly with the erection of the first water frame for spinning, in Rhode Island, in 1790, it has attracted in a marked degree the enterprise and ingenuity of the American people, and is now an established industry in twenty-nine States of the Union. It exceeds all other branches of pure manufacture in value of product, and in the employment which it gives to capital and labor, to agriculture and the domestic arts, and to internal and foreign trade. Its annual product in 1860 was about one-sixteenth of the aggregate of all branches of industry, including the large items of flour and meal, sawed and planed lumber, the fisheries, and of coal and the baser metals. Its ratio of development has exceeded that of the population, and in the last twenty years has been 150 per cent.; population in the same time having augmented only 84.2 per cent.

The seventh census gave the number of cotton factories in twenty-five States in 1850 as 1,074. The number of spindles in use at that time has been estimated at 3,633,693. The aggregate capital invested was \$76,032,578. The value of raw material consumed (including 641,240 bales of cotton, equal, at 425 pounds each, to 272,527,000 pounds) amounted to \$37,778,014. The number of hands employed was 32,295 males and 62,661 females, or 94,956 persons. The total value of the manufactured product was \$65,501,687, and included the value of 763,678,407 yards of cloth, and nearly 30,000,000 pounds of yarn and batting. This product was exclusive of mixed goods of cotton and wool, &c., which employed 103 manufactories, and amounted in value to \$3,693,731.

The official returns of 1860, make the number of cotton manufacturing establishments in twenty-nine States of the Union, on the 30th of June, to have been 1,091. The aggregate amount of capital invested was \$98,585,269, an increase of \$22,552,691, or 29.6 per cent. upon the total capital of 1850. The quantity of cotton consumed, exclusive of 15,200,061 pounds wrought into mixed fabrics of cotton and wool, was 422,704,975 pounds, equivalent to 1,056,726 bales of 400 pounds each, which was 150,177,975 pounds, or 55.5 per cent. in excess of the consumption in 1850. The total cost of raw material was \$57,285,534, and of labor \$23,940,108, the increase in the former being in the ratio of 51.6 per cent., and in the latter of 38.6 per cent. The average number of male hands employed throughout the year was 46,859, and of females 75,169, an increase of 14,564 males, and 12,508 females, and of 28.5 per cent. on the aggregate number of operatives in 1850. The aggregate number of spindles in operation was 5,235,727, and the number of looms 126,313, in the proportion of 41.4 spindles per loom. The total value of all kinds of cotton goods manufactured was \$115,681,774, which exceeded the product of 1850 by \$50,180,087, or 76.6 per cent.

The product of cotton cloth, including 271,857,000 yards of printing cloths, amounted to 1,148,252,406 yards; the quantity of yarn and thread to 47,241,603 pounds; and of bats, wicking, and wadding to 12,967,956 pounds, being an increase over the product of 1850 of 384,573,990 yards, or upwards of 50.3 per cent. in the quantity of cloth, and of more than 30,000,000 pounds, or 100 per cent. in the quantity of yarn, batting, &c.

In addition to the foregoing, the product embraced a large aggregate of miscellaneous articles and fabrics, among which were the following: coverlets, 11,590; table-cloths and counterpanes, 11,600; quilts, 122,000; mosquito netting, 1,582,400 yards; cotton cordage, twines, lines, &c., 4,876,277 pounds;

webbing, 450,000 pounds; quilts, 195,391 pounds; seamless bags, 6,235,600. The consumption of cotton in unmixed goods was in the proportion of 13.4 pounds for each individual in the Union, and averaged 80.7 pounds for each spindle. The production of cotton goods of all kinds per capita in 1850 amounted in value to \$2 82, and in 1860 to \$3 60. The average value per spindle made in the latter year was \$22 09, the cost of the same being, for material, \$10 94, and for labor, \$4 57; and for both together, \$15 51 per spindle.

The number of yards of sheetings, shirtings, printing cloths, &c., amounted to about thirty-six and one-quarter yards per capita for the total population of the Union, or about three times the estimated annual consumption per head in 1830. It was an average of 219 yards per spindle, and of 9,090 yards for each loom per annum.

The average annual wages of each factory hand was \$196, or twenty dollars more than the average earnings in 1850.

The average value per hand of the total product in 1850 was \$668, and in 1860 it was \$948 per annum.

The following are the ratios of increase in the several elements of this manufacture as compared with the aggregates in 1850, viz: increase of capital, 29.6 per cent.; in cost of material, 51.6 per cent. in cost of labor, 38.6 per cent; in consumption of cotton, 55.5 per cent.; in number of hands employed, 28.5 per cent.; in yards of cloth made, 50.3 per cent.; and in value of product, 76.6 per cent.

The augmentation of the value of cotton goods made, as compared with the product in 1850, took place principally in the New England and middle States. The aggregate manufacture of seven factories in the States of Illinois, Louisiana, Texas, and Utah, which made no returns in 1850, amounting in value to only \$576,182, of which sum \$466,500 was the product of two establishments in Louisiana.

The six New England States contained 570 establishments, representing an aggregate capital of \$69,260,279; an annual expenditure for raw material of \$37,670,782; and for labor of \$16,720,920. They employed 29,886 male, and 51,517 female hands throughout the year, and contained 3,858,962 spindles, and 93,344 looms, which consumed 283,701,306 pounds of cotton, an average of 73 pounds per annum for each spindle. The total value of their manufacture was \$79,359,900, an increase of \$35,573,910 over the product of 1850. In this were included the values of 857,225,347 yards of cloth, of which 211,687,382 yards were printing cloths; of 12,409,527 pounds of yarn and thread; and of 5,648,240 pounds of bats, wicking, wadding, &c., besides quilts, bags, cordage, lines, &c.

The following figures represent the increments in the several aggregates and their ratios, as compared with the returns from the same section in 1850, viz: increase of capital, \$16,308,914, or 30.8 per cent.; increased annual cost of labor, \$4,425,352, or 35.9 per cent; of raw material, \$12,906,742, or 52.1 per cent; increased number of hands, 18,400, or 29.2 per cent; increased value of product, \$35,573,910, or 81.24 per cent. The increase of spindles in New England compared with returns for 1850 not made up, but collected and published semi-officially, appears to have been about 1,107,834, or 40.2 per cent; of looms, 9,704, or 11.6 per cent; and the increased production of cloth, about 260,357,840 yards, equivalent to 43.6 per cent. The average number of spindles to each loom in these States was 41.3. The production of cotton cloth amounted to 225 yards to each spindle, and 9,194 yards to the loom. The average cost per spindle of all kinds of goods (for labor and material) was \$14 17, and the returned value per spindle \$20 56. On the above data these results show an increase of nine yards per spindle, and 2,058 per loom over the product in 1850, and of six yards per spindle, and 104 yards per loom over the average production of the whole Union in 1860, the average cost being at the same time \$1 34, and the returned value \$1 53 per spindle less than the general average of the Union.

The average annual wages of each hand in New England was \$205 15, and the average product per hand was \$974 90, the wages being upward of \$9, and the product \$25 per hand greater than the average for the whole United States. The production in cloth alone was an average of 10,536 yards to each hand, or 1127 yards more than the general production per hand.

The total value of cotton goods was equivalent to \$25 31 for each inhabitant of New England, and to \$2 52 for each person in the Union.

Of the general aggregates of the cotton manufacture, upwards of seventy per cent. of the total capital, more than sixty-eight per cent. of the entire product, nearly seventy-eight per cent. of the printing cloths, and about seventy-five per cent. of the whole quantity of cloth made, as well as a principal part of the webbing, quilts, seamless bags, lines, twines, &c., were returned by the New England factories.

The ratios in which those States severally augmented their products were in the order of their productive values, respectively, as follows: Massachusetts, 77.10 per cent.; New Hampshire, 54.6; Rhode Island, 87.05; Connecticut, 116.14; Maine, 137.4; Vermont, 27.5.

Nearly forty-eight per cent. of the whole value of cotton goods made in New England was the product of Massachusetts, which returned 217 establishments, containing 1,673,498 spindles, and 42,779 looms, on which were made 415,291,438 yards of cotton cloth, an average of 248 yards to each spindle, 9,707 yards to each loom, 10,800 yards to each factory hand, and 337 yards to each person in the State. The total value of cotton goods of all kinds made in that State was \$38,004,255, an increase, of \$16,609,854, and equal to a product of \$22 72 per spindle, \$988 per factory hand, and \$31 60 for each person in the State. The number of employés was 13,691 males, and 24,760 females, whose average annual earnings was \$202. The consumption of cotton was 134,012,759 lbs. an average of 80.7 pounds per spindle; and the average cost of production per spindle in labor and material was \$14 95. Rhode Island produced the greatest amount of printing cloths and yarns; Connecticut the most cords, lines, and twines, and New Hampshire the greatest number of seamless bags.

The six middle States numbered 340 establishments, which was twelve less than in 1850. The invested capital was \$18,789,069; the cost of raw material, \$13,928,671; annual cost of labor, \$5,462,900; and total value of the product, \$26,531,700, an increase in the last item of 79.52 per cent. in ten years. The business in this section employed annually 12,212 male and 16,866 female hands, 1,042,480 spindles, and 25,185 looms, and consumed 87,113,715 pounds of cotton, which produced 228,702,748 yards of cotton cloth, of which 60,169,618 yards were printing cloths, 16,212,651 pounds of yarn and thread, and 5,699,016 pounds of bats, wadding, wicking, &c., besides cotton cordage and other miscellaneous products. The proportion of spindles to looms, and the number of yards of cloth made per spindle and loom, were about the same as for the United States at large, but the product was about five and one-half yards per spindle, and 105 yards per loom less than in New England, while the consumption of cotton per spindle (83 5 pounds) was nearly three and one-half pounds greater than the general average, and ten and one-half pounds more than that of New England. The average cost of production per spindle for material and labor was \$18 60, which was \$3 06 greater than the average for the whole country, and \$4 43 per spindle greater than in New England. The value of the manufacture was \$25 45 per spindle, or \$3 36 greater than the average of the Union, and \$4 89 greater than in New England. The excess in cost of production was principally for material, which amounted to \$2 42 per spindle more than the general cost, and to \$3 60 more than in the eastern States. These discrepancies are probably due to the less full and complete returns of the number of spindles in the middle States, and in part, perhaps, to the manufacture of a heavier and coarser description of goods in that section generally; the cost of labor being diminished, and the quantity and cost of material increased in proportion to the weight or coarseness of the fabric. The greater amount of yarn and thread made in New England, and, perhaps, the somewhat greater speed of machinery in that section, may have also influenced the results.

The annual wages of each operative in the Middle States averaged \$187 86, being \$8 26 less than the average wages of the Union, and \$17 29 less than in New England. The product per hand amounted in value to \$912 18, which was \$35 82 less than the value produced generally, and \$62 72 per annum less than each operative produced in New England. The value of cotton goods was in the

proportion of \$3 18 per capita for each inhabitant of the middle States. It was equivalent to 22.9 per cent. of the total product of the Union, the number of spindles and looms, and the number of yards of cloth amounting each to about twenty per cent., and the quantity of yarns, &c., to upward of thirty-four per cent. of the entire product of the Union.

Of the aggregate product of the middle States, Pennsylvania, with 185 establishments, having a capital of \$9,203,040, and employing 476,979 spindles, 12,994 looms, and 14,994 hands, manufactured 114,395,986 yards of cotton cloth, including 14,025,200 yards of printing cloth, 9,739,181 pounds of yarn and thread, 2,072,500 pounds of bats, wicking, wadding, &c., and 11,230 coverlets. The total value of these products was \$13,650,114, the quantity of cloth and the entire value of the manufacture constituting upward of fifty per cent. of the whole product of these States. Pennsylvania, in the value of its cotton manufacture, fell only a little behind New Hampshire, which holds the second rank in this industry. It is probable that more accurate returns from the numerous small factories in the former State would have shown it to be next to Massachusetts, the largest producer of cotton goods. No other State north of Virginia, with the exception of Maine, showed so large a ratio of increase in this branch since 1850. The consumption of cotton in the State was 37,496,203 pounds, equal to 70.8 pounds per spindle. The number of spindles was in the proportion of 36.7 to each loom, and the quantity of cloth made averaged 239.8 yards per spindle, 8,803 yards to the loom, and 39.3 yards to each inhabitant of the State. The cost of the goods of all kinds averaged, for material \$15 50, and for labor \$5 80 per spindle, a total cost of \$21 30 per spindle. The returned value of the goods averaged \$28 61 per spindle, \$910 per factory hand, and \$4 70 for each man, woman, and child in the State. The employes received, one with another, \$184 63 as annual wages.

The State of New York had seventy-nine factories, and produced annually in cotton goods a value of \$6,676,878, or nearly one-half as much as Pennsylvania, and more than one-half of all the printing cloths made in the middle States. New Jersey and Maryland each fell a little short of \$3,000,000 in the value of their manufacture, the former of the two making much the larger amount of yarns and netting, and the latter more yards of cloth.

The eleven southern States, including Texas, returned the same number of establishments (159) as in 1850. Their combined capitals aggregated \$9,596,221; the expenditure for raw material, including 43,960,510 pounds of cotton, \$4,739,371; cost of labor, \$1,440,424; the product of manufacture, \$8,145,067, the last sum being an increase of \$2,479,705, or forty-three per cent. upon the returns of the previous census.

In these States there were 290,359 spindles and 6,713 looms, a proportion of 43.2 spindles to each loom. The male hands numbered 3,983, and the female 5,923, making in all 9,906 hands, whose average annual wages was \$145 41, and the product of their labor \$822,331. The consumption of cotton was in the proportion of 151.4 pounds to each spindle annually. The average annual cost for material was \$16 31, and for labor \$4 96 per spindle, making the total cost of the goods for labor and material \$21 27 per spindle, the returned value of the product being \$27 10 per spindle. The product embraced 53,352,658 yards of cotton cloth, 15,369,825 pounds of yarn, &c., 39,400 pounds of bats, wicking, wadding, &c., and (by Tennessee) 90,000 pounds of cotton cordage.

In consequence of the more general prevalence of household manufactures and of family looms among the sparser population of those States, the proportion of spindles to looms in the regular factories, and the production of yarn, as well as the consumption of cotton, was relatively greater, and the production of cloth smaller than in the older manufacturing States. The quantity of yarn made in the southern establishments amounted to 32.5 per cent., or nearly one-third of the whole—considerably exceeding the product of New England, nearly equalling that of the middle States, and equivalent to 1.6 pounds for each individual of the entire population of the States represented. The quantity of woven goods returned only averaged 183.7 yards to the spindle, which was 35 yards less than the general average, and 41 yards less than in New England. The average product of each loom was 4,947 yards, or 1,143

yards less than the average of the United States, and 1,247 less than was made on each loom in New England. The value, per capita, of the total product of these States was 89 cents, and the quantity of cloth 5.8 yards.

The southern States produced 6.7 per cent. of the aggregate value of cotton goods made in the United States. The number of spindles and looms was upward of 5 per cent., the quantity of cloth 4.6 per cent., and of yarn 32.5 per cent. of the whole. Much of the yarn made in this section was sold in New York and Philadelphia.

Of the southern States, Georgia was the largest manufacturer of cotton goods, having thirty-three establishments, with a capital amounting to \$2,126,103, and mounting 85,186 spindles and 2,041 looms. These concerns employed 2,813 hands, the product of whose labor was \$2,371,207, an increase of 69.97 per cent. upon the returns of 1850. Only three other States, Virginia, North Carolina, and Alabama, exceeded one million in the value of cotton goods, the ratio of increase in the first two being small, (two or three per cent.,) and in the latter equal to 160.96 per cent. In Mississippi, Arkansas, and Tennessee the product, though small, was considerably greater than in 1850, and in South Carolina and Florida was somewhat less than in that year.

Of the western States, six, including Utah, made returns on the subject of cotton manufactures. They contained twenty-two establishments, having 43,926 spindles and 1,071 looms, in the proportion of 41 spindles to the loom, and employed 1,641 hands. Their aggregate capital was \$939,700; the cost of material \$946,710, and of wages, \$313,992 per annum, the last averaging \$191.57 for each hand. The consumption of cotton amounted to 7,929,444 pounds, an average of 180½ pounds to each spindle. The aggregate value of the cotton goods made was \$1,642,107, which was an increase of upward of 80 per cent., and comprised the values of 8,971,653 yards of cloth, 3,249,600 pounds of yarn, and 1,581,300 pounds of batts, wicking, &c. Of cotton cloth alone, the manufacture was at the rate of 204 yards to the spindle, and 8,376 yards to the loom. The total cost, per spindle, of the entire product, was \$28.69, of which \$7.14 per spindle was for labor, and \$21.55 for material. The returned value of all kinds of cotton goods made averaged \$37.38 per spindle, and was equivalent to \$1,002 per annum for each hand, and to 21 cents for each inhabitant of those States. These results show that the consumption of cotton, and the cost for material and labor per spindle, as well as the value of the product per spindle and factory hand, was relatively greater than in the United States at large, or any section of it; that the average annual wages of each hand was greater than in the middle and southern States, but less than in New England; and that the extent of the cotton manufacture, as compared with the population, was less than in the other divisions of the Union, as shown by the value per capita.

Of the aggregate value of cotton goods these States produced 1.4 per cent.; of the quantity of cloth only 0.78 per cent.; and of yarn 6.8 per cent.; the number of spindles and looms amounting, each, to about 0.84 per cent. of the whole number.

Among the western States the lead in the cotton manufacture was taken by Ohio, the product of which, though less than three-quarters of a million in value, was equal to 44 per cent. of the whole amount made in those States, and 21.7 per cent. greater than its return in 1850. Indiana, with three establishments less than in 1850, augmented its product from \$86,660 in that year to \$344,350, which was in the ratio of 297.6 per cent. Missouri showed an increase of nearly 61 per cent., and Kentucky, which is third in rank, reduced its factories from ten to six, and depreciated its product in the ratio of 29.2 per cent.

The average value of cotton goods manufactured, per spindle, in the New England States was \$20.56; and in the several States of that section as follows: In Massachusetts, \$22.70; Maine, \$22.18; New Hampshire, \$21.51; Connecticut, \$20.46; Vermont, \$20.31; and Rhode Island, \$14.91. In the middle States the product per spindle averaged \$25.45. In Maryland it was \$57.37 per spindle; in Pennsylvania, \$28.61; in Delaware, \$24.16; in New Jersey, \$17.95; and in New York, \$19.15. The average value of the product for each spindle in the southern States was \$27.10; and in the western States \$37.38. The difference in the relative values of the product, per spindle, in the several States and sections of the Union was, in a great measure, due to the greater amount of yarn

made in some of them, either for household consumption, or for sale in other States, to be woven in regular factories. Thus the southern States, as already stated, produced nearly one-third of the whole quantity of yarn returned, and less than one-twentieth part of the cloth made in the Union. The consumption of cotton, per spindle, varied for the same reason, being relatively greater in those States which chiefly confined their operations to spinning, than in the manufacturing centres, where its ultimate elaboration into the finer fabrics took place. The average annual amount of cotton consumed by each spindle in New England was only 73 pounds, and in the middle States, which bought yarn of the south, it was 83 pounds. In the southern States, on the other hand, the average consumption was 151 pounds, and in the western, 180 pounds per spindle.

#### HISTORY AND STATISTICS.

The rapid development of the cotton husbandry and manufacture of the United States, and the still more extraordinary extension of the manufacture in Great Britain, are among the most remarkable correlated and concurrent events of the past century.

The first experimental planting of cotton-seed in this country was made in Virginia, under the auspices of the London Company, in 1621, twenty years previous to the first authentic mention in England of any textile fabrics containing cotton as a material. Cotton, from Smyrna and Cyprus, whence the first seed generally planted in this country was probably obtained, had been used in England for several centuries as a material for lamp-wicks, and had, it is supposed, been for some time coming gradually into use in Manchester in the manufacture of cloth previous to 1641, when fustians, dimities, &c., composed, in part, of cotton-yarn imported from the Levant, are mentioned in a tract by the Lewis Roberts.

Although the raising of cotton was scarcely attempted in Carolina and Georgia until a century later, and throughout the south occupied little more than garden patches before the Revolution, the active colonial trade with the West India islands furnished small quantities of the indigenous cotton of those islands in exchange for the products of the continental colonies.

As early as May, 1640, the general court of Massachusetts made an order for the encouragement, by bounties, &c., of the manufacture of linen, woollen, and cotton cloth. In this it was followed, about nine months after, by the assembly of Connecticut, which took measures to encourage the importation of cotton-wool from Barbadoes. About the same time a company of Yorkshiresmen who settled at Rowley, Massachusetts, in 1638, engaged in spinning and weaving cotton, flax, and wool, and in 1643 erected at that place the first fulling mill in America. From that time until about 1773, both the cotton manufacture of England and the very limited household industry of the American colonies was chiefly confined to the production of coarse, mixed fabrics, such as fustians, composed of linen warp and cotton weft, like the goods now called "Unions," which constituted much of the ordinary wear of both countries. The demand for cotton in England was consequently limited, the total importations in 1781 amounting to only 5,198,778 pounds. The manufacture of calicoes was first attempted in England in 1765, and more successfully by Arkwright & Co., in 1772, in which year the Messrs. Strutt, of Derby, also made the first cotton goods in England with a cotton warp, spun on the water-frame patented by Arkwright in 1769—neither the first spinning jenny invented by Higs, in 1763, nor the more efficient machine of Hargraves, introduced the next year, giving the thread sufficient twist to form a warp yarn. About this time, also, the bleaching and printing of cottons had become general in England. The introduction of the mule-spinner, by Crompton, in 1775; of steam-carding and spinning, by the Watt's engine, about 1783; of the power-loom, by Cartwright, a few years later; of cylinder-printing, by Bell, in 1785; and the use of chlorine in bleaching, near the same time, with a few minor agencies, completed a train of improvements in this branch which gave the first great impulse to the cotton manufacture in England, and opened up a market for the raw material to all countries.

In 1784, when the first importation of cotton from the plantation States into England was made, in the trifling amount of eight bags, weighing, altogether, 1,200 pounds, the total consumption of Great Britain amounted to about 11,250,000 pounds, or a little more than the average monthly consumption

of the cotton mills in Massachusetts in 1860. In 1812 the quantity of raw cotton imported for consumption from all countries was about 61,250,000 pounds; in 1830 it was 242,000,000; in 1840, upwards of 528,000,000; in 1850, 629,750,000; and in 1860 reached nearly 974,000,000 of pounds. Stimulated by the combined influences of the textile improvements just referred to, which created a demand and still more by the agency of the saw-gin for cleaning cotton, introduced by Whitney in 1793, by improvements in ship-building and navigation, and by the use of steam power for stationary and locomotive machinery, the United States has for many years past furnished a large proportion of the cotton consumed in this country and in Europe. In the first year of the present century the total cotton crop amounted to about 40,000,000 of pounds; in 1820 to 160,000,000; in 1830 to 350,000,000; in 1840 to 790,000,000; and in 1850 to 978,000,000 of pounds, or 2,445,793 bales. In 1860 the total crop of ginned cotton was 2,154,820,800 pounds, or 5,387,052 bales, of 400 pounds each, or more than double the product of 1850, and nearly 90 per cent. of the estimated product of all countries, which, exclusive of the domestic consumption of semi-barbarous nations, was placed at six million bales. Our total exports of cotton in that year were 4,419,215 bales, of which Great Britain took 3,037,762 bales, equivalent to 80 per cent. of her total imports of that material, and France more than one-half the remainder.

The quantity of cotton manufactured in the United States in 1791 was about 5,500,000 pounds; in 1801, 9,000,000; in 1811, 17,000,000; in 1821, 50,000,000; in 1831, 77,500,000; in 1841, 97,500,000; and in 1850, 245,250,000 pounds; those quantities being exclusive of the consumption of Virginia and the States south and west of it, except Richmond and vicinity. The consumption of cotton in regular factories of unmixed cotton goods in all the States amounted, in 1860, to 422,704,975 pounds, or 1,094,762 bales, of 400 pounds each.

The manufacture of cotton, which is now the predominant industry of this country as well as of Great Britain, properly dates from the introduction of the Arkwright machinery, in 1790. As early as 1775 a spinning jenny of twenty-four threads was put in operation by a joint-stock company at Philadelphia, where, in 1782, Samuel Wetherell, jr., one of the company, advertised for sale probably the first factory-made "jeans, fustians, everlastings," &c., in this country. Associations to manufacture by machinery were also formed in 1780, at Worcester, Massachusetts, where "jeans, corduroys, federal rib, and cottons" were advertised by S. Brazier in 1790; at East Bridgewater in 1786; at Beverly in 1787; and at Providence, Rhode Island, in the same year, and at Baltimore in 1789. Brass models of the Arkwright machines had also been procured in England in 1786, for a company in Philadelphia, but were seized and confiscated on the eve of their shipment, under the British laws prohibiting the exportation of machinery. During the same year, however, descriptions and models of an early and imperfect form of these machines were, with difficulty, brought from England by Thomas Somers, of Baltimore, where the cotton manufacture had also been proposed in 1785. The models became the property of the State of Massachusetts. That State, about the same time, paid two Scotchmen—Robert and Alexander Barr—£200 for the first spinning jenny and stock card probably ever made in this country. These last were built for the honorable Hugh Orr, at his iron-works, in East Bridgewater, and, with the Arkwright models, were deposited with him by the State for public benefit. In 1787 a company at Beverly, with machines made from these models, or imported, and with other costly machinery, attempted, with partial success, to manufacture cotton, in which they were aided by a grant of £500 from the State. A spinning-frame of thirty-two spindles was also made after the State model, for Daniel Anthony, of Providence, Rhode Island, and was operated at that place by hand-power, making, it is said, the first thread ever spun in this country by machinery. Proving too heavy for hand-power, it was soon after sold to Moses Brown, who endeavored, with little success, to run it by water-power at Pawtucket. With this and a second water-frame of twenty-four spindles from the same model, which had failed to work at East Greenwich, the spinning of cotton warp was for a while tried and abandoned. These two discarded water-frames, with two jennies, a doubling and twisting machine, and a calendering machine, constituted the principal machinery of Almy & Brown when Samuel Slater arrived from England, in the autumn of 1789.

That ingenious manufacturer had been a clerk, and afterward an overseer in the cotton establishment of the enterprising firm of Strutt & Arkwright, at Milford, in Derby, and was familiar with the most improved mechanism in use in England. Attracted hither by the liberal inducements held out to manufacturing enterprise in the United States immediately after the war of independence, he arrived opportunely, just as the first efforts to introduce the cotton manufacture here seemed to have entirely failed. He was invited to Rhode Island, and having at once rejected the old machinery as worthless, he entered into contract with the proprietors, and, without drawings or models, in January, 1790, set about constructing perpetual carding and spinning machinery, chiefly with his own hands. On the 20th of December of the same year he put in operation by water-power at Pawtucket three carding, one drawing and roving machine, and two Arkwright spinning-frames of seventy-two spindles, which was the first machinery of the kind successfully operated in the United States.

Up to this time no sheetings, shirtings, checks, or ginghams had been made in this country, and the warp for the first goods wholly of cotton was supplied by this water-frame cotton mill, the product of which, small as it was, during the first twenty months far exceeded the demand of the hand-weavers and buyers. In 1793 Almy, Brown & Slater erected at Pawtucket village, in North Providence, a small factory, afterward known as the "Old Factory," to contain seventy-two spindles. They added machinery from time to time, and subsequently enlarged the building and built another.

During the ensuing year the first cotton sewing-thread ever made is said to have been spun from sea-island cotton—the cultivation of which was just beginning in the south—by Mr. Slater, to whom is also attributed the first introduction of cotton stocking-yarn in America. The prices of cotton yarn at that date in Rhode Island were, for No. 12, 88 cents; for No. 16, \$1 04; and for No. 20, \$1 21.

In 1798, Mr. Slater, with several of his wife's relatives, under the name of Samuel Slater & Co., built on the east side of the Pawtucket river, in Massachusetts, a "new mill," in which he owned one-half the stock, and which was the first cotton factory on the Arkwright principle in that State.

These two small establishments, which were the initials of the great cotton industry, not only in the States of Massachusetts and Rhode Island, but of the whole Union, were, directly or indirectly, the sources whence the workmen who erected cotton mills in different parts of the country previous to 1809 drew their knowledge of the business. They were also so remunerative to their owners that, in 1806—in which year two cotton mills were also started at Cumberland, Rhode Island, and two more at North Providence—Almy, Brown & Slater were able to project a manufacturing village at Slatersville, in Smithfield, Rhode Island. It went into operation the following year with all the recent improvements brought from England by John Slater, a brother of Samuel, to whose management it was intrusted, and eventually became the sole property of himself and the heirs of Samuel, who died in 1835. The family were enriched by the profits of this factory, which, within twelve years, became the centre of nine cotton mills, containing 11,000 spindles, one-half of them in the original factory, at that time, and for many years after, the largest in the Union. In 1812 Pawtucket, Rhode Island, contained twenty-four cotton mills, and upward of 20,000 spindles.

Through the influence of Secretary Hamilton, a company was incorporated in 1791 with a capital of \$1,000,000, with a view, primarily, to the manufacture of cotton. Having selected the Great Falls of the Passaic, now Paterson, New Jersey, as the site, they completed a cotton mill, ninety feet by forty, four stories high, in 1794, and the same year spun by water-power, as they had done the previous year by animal-power, the first yarn made by machinery in that State. They also printed calico, shawls, and cotton goods, buying the muslins in New York.

About 1795 the first small cotton mill in Delaware was put in operation by horse-power at Wilmington, by Jacob Broome, and calico printing was also attempted. The cotton machinery was afterward removed and run by the water-power of the Brandywine.

In 1803 the first cotton factory in New Hampshire was built at New Ipswich, and in 1804 the first regular factory in New York was erected at Union village, in Washington county, by W. Mowry, a former pupil of Slater. About the same time the business was commenced in Connecticut, at Vernon, in Hartford county, and was followed in 1806 by a larger one at Pomfret.

In that or the following year cotton machinery, clandestinely obtained from England, was introduced into a large factory, previously run as a woollen mill, at Byfield, Massachusetts, and for a time was employed upon warp yarn and wicking for household manufactures. A few years after, the manufacture of tickings, coarse ginghams, and sheetings, and similar heavy articles, was commenced there, being, it is said, the first of that class of goods made in this country. These were all woven in hand-looms, power-weaving not being in use at that date. The price of ginghams at that time was seventy-five cents, and of sheetings fifty cents a yard.

It was during this year (1804) that the first consignment for sale of American manufactures was made by Almy & Brown, of Providence, to Elijah Warren, of Philadelphia, who became their agent for selling American yarns and threads in great variety, to which were added, as business improved, stripes, plaids, checks, denims, tickings, &c.

In 1808 a company was incorporated in Maryland, with a capital of one million dollars, to manufacture coarse cotton goods on a large scale, which they carried into operation on the Patapsco, at Ellicott's mills, in 1810.

In an official report made to Congress by the Secretary of the Treasury early in 1810, the number of cotton mills erected up to the close of the previous year, including twenty-five then building to go into operation, was stated to be eighty-seven. Of these, sixty-two were in operation, and worked 31,000 spindles, requiring a capital of about \$100 per spindle, of which \$60 was actively employed. The average consumption of cotton per spindle was forty-five pounds, worth twenty cents per pound, and the product thirty-six pounds of yarn per spindle, worth, on an average, \$1 12½ per pound. They employed, on an average, five men and thirty-five women to every 800 spindles. It was estimated that these eighty-seven mills would employ, in 1811, 80,000 spindles and 4,000 hands, and have a capital of \$4,800,000; that they would consume 3,600,000 pounds of cotton, worth \$720,000, and produce 2,880,000 pounds of yarn, worth \$3,240,000. The increase in regular establishments in two years had been fourfold, and in three years would be tenfold. The mills were distributed as follows, the greater part of them being within thirty miles of Providence, the cradle of this industry: Rhode Island had in operation 18 mills, building 7; Massachusetts 10, building 5; Connecticut 4, building 2; Pennsylvania 4; New York 3, building 3; Maryland 3, building 2; New Hampshire 2, building 4; Vermont 2, building 2; New Jersey 2; Delaware 2; Maine and Virginia each one; and the following horse-mills: in South Carolina, Georgia, Tennessee, and Ohio, each 1; Kentucky 6. Of the foregoing, two in Pennsylvania, one in Delaware, and one in Maryland were also horse-mills.

Seventeen mills in the vicinity of Providence, where all the new ones were being built, contained 14,196 spindles, and were estimated to have consumed 640,000 pounds of cotton, producing 510,000 pounds of yarn for home consumption or exportation. They employed 1,100 looms in weaving, chiefly tickings, at 55 to 90 cents a yard; checks at 30 to 42 cents; ginghams at 40 to 50 cents; shirtings and sheetings at 35 to 75 cents a yard; and cotton counterpanes at \$8 each.

The first census of manufactures, taken in that year by government, give no less than 269 cotton establishments, scattered throughout eighteen States and Territories, and running about 87,000 spindles. The returns furnished no reliable statement of the quantity or value of the articles produced, because of their incompleteness and want of discrimination between pure and mixed manufactures, and the machinery used in their production. The factories are known to have been small, producing chiefly yarns, and from one to eight thousand yards of cloth each per annum. The greater part of the domestic cotton then consumed was spun and woven in families, and the aggregate number of yards returned as so made was 16,581,299, an amount estimated to exceed in measurement all the cloths of flax, hemp, wool, and silk made in that year. The returns from Massachusetts include 200 pieces of cotton duck, valued at \$6,000.

Cotton duck, which of late years has been so extensively made and consumed in our own country, and has entered so largely into our exports of domestic cotton fabrics, was then a new article, having been just introduced by Mr. Seth Bemis, a manufacturer of Watertown, Massachusetts, who, during the previous year, sold in Boston the first lot at 65 cents per yard for No. 1, and 58 cents for No. 2, the

material used being sea-island cotton. During the war it rose in price to \$1 per yard, and in 1816 Mr. Bemis applied the power-loom to its manufacture, in which he was followed, in 1824, by Mr. Colt, of Paterson, New Jersey, who had begun its manufacture two years before, using double and twisted yarn. Its manufacture was attempted in Baltimore in 1825, and in 1840 the Lowell duck mill was started exclusively for the production of cotton duck.

It was also during the year 1810 that cotton goods were first printed in this country upon engraved copper rollers, at the bleach and print works of Thorp, Siddell & Co., near Philadelphia. Calico printing from wooden blocks had been carried on at that place since the year 1788, or earlier. About that time John Hewson, sr., a revolutionary officer, in consequence of premiums offered by a society of arts and manufactures in Pennsylvania, whose liberal offers are said also to have finally induced Samuel Slater to come to America, commenced calico printing at Dyottsville, in Philadelphia, encouraged by a loan of £200 from the province. In 1803, beside Hewson's, there were two other print works in that city, printing annually about 300,000 yards of Calcutta cloths. In 1790 this business was also undertaken at East Greenwich, Rhode Island, by H. Vandusen, who engraved his own blocks. In 1794 calico printing on a large scale was first commenced at Providence, by Schaub, Tissot & Dubosque. India cottons, of which the importations were large, were at first exclusively used in these establishments. The printing was done by wooden blocks, each color requiring a separate engraving. The cloth was spread on a table and the stamping done by hand.

The first cylinder machine was imported by Mr. Siddell from England, and in 1809 was put in operation by water-power about eight miles from Philadelphia, enabling one man and two boys to print daily 10,000 yards of cloth. In 1822 the engraving of metallic rollers for calico printers was commenced in Philadelphia by Mason & Baldwin, who took out letters patent in 1827 for biting figures on steel cylinders. Large print works were erected in 1823 at Lowell, and about the same time at Taunton, Massachusetts, and Dover, New Hampshire, and were followed soon after by others at Fall River, Massachusetts; at Columbiaville, New York; Belleville, New Jersey; Philadelphia, Pennsylvania; Baltimore, Maryland; and other places. In 1826 about 60,000 yards were printed weekly in New England; and in the year ending April 1, 1836, the quantity of calicoes printed in the United States was 120,000,000 yards. The Manchester Print Works, in New Hampshire, was incorporated in 1839. The manufacture of cotton was rapidly extended during the suspension of foreign trade, caused by the war of 1812. It was seriously checked on the return of peace by the competition of English manufacturers, among whom the use of the power-loom had, in the mean time, become general. The importation of foreign cottons in the first two years of peace amounted in value to \$180,000,000. Our manufacturers sought relief in efforts to obtain the power-loom and in protective tariffs.

For the successful introduction of the power-loom we are indebted to the enterprise of the Boston Manufacturing Company, chartered in February, 1813, and to the talent and energy of Francis C. Lowell, its projector, assisted by Paul Moody, a skilful mechanic of Amesbury. They built a factory of about 1,700 spindles at Waltham, Mass., for the manufacture of cotton fabrics on a large scale by the aid of the power-loom, the first of which was constructed by Messrs. Lowell & Moody, with several improvements upon the English loom then in use. With its necessary accompaniment, a dressing machine, also rendered much more efficient than the patent machine of Horrock's, and, with like improvements in other parts of the machinery, it was put in operation in the autumn of 1814, in the first manufactory in which all the processes of manufacture were carried on in a single establishment. The first goods woven by the company were heavy unbleached sheetings of number fourteen yarn, thirty-seven inches wide, forty-four picks to the inch, and in weight something less than three yards to the pound; a class of goods which, under the name of "domestics," have ever since formed the staple of American cotton manufactures. During the same year the Scotch loom engine and dressing machine were introduced at Providence, R. I., by William Gilmoir, from Glasgow.

The success of the Waltham factory, which was the introduction of the cotton manufacture on a large scale, induced its principal owners, Messrs. P. T. Jackson, Nathan Appleton, with Kirk Boott and

others, to undertake largely the manufacture and printing of calicoes. With this view the Merrimac Manufacturing Company was incorporated in February, 1822, and in September of the following year the first wheel was started at East Chelmsford, which took the name of Lowell, and the capital stock (since more than doubled) was increased to \$1,200,000. Print-works were erected the same year to print the company's calicoes in madder colors. In 1825 the Hamilton Manufacturing Company was organized at Lowell, and, under the superintendence of Mr. Samuel Batchelder, of New Ipswich, now treasurer of the York Manufacturing Company, at Saco, Maine, the power-loom was there first applied to the manufacture of twilled and fancy goods with great success. That was also the first establishment to make cotton drills, which have since entered so largely into the American export trade, especially to China. Its print-works went into operation in 1828. In 1860 Lowell contained twelve incorporated companies, having an aggregate capital of \$13,900,000, and mounting 403,696 spindles, and 12,190 looms, which produced annually 2,481,000 yards of cotton, besides woollen cloths, carpets, &c., &c. The number of mills, including print-works, bleacherics, and dye-works, machine-shops, &c., was fifty-four.

With the introduction of power weaving and the numerous other mechanical improvements of domestic or foreign origin that followed, and encouraged by the protection given in 1816 by a duty of twenty-five per cent. ad valorem on foreign cottons, continued in later acts, and coupled with a rule of valuation which virtually excluded the low-priced India cottons, manufacturing establishments increased in size, number, and completeness of arrangement.

In 1820, according to the imperfect returns of the marshals, the number of spindles in cotton factories in fifteen States, including the two Carolinas, Ohio, and Kentucky, was upward of 250,000, and the amount of cotton used about 10,000,000 pounds, or forty pounds per spindle. This was an increase in ten years of 213 per cent. in the number of spindles, and of 176 per cent. in the consumption of cotton, as compared with Mr. Gallatin's report. It was, however, a large falling off from the consumption of cotton in 1815, which was reported to Congress in the following year at 27,000,000 pounds.

In 1826 New England was estimated to contain 400 distinct factory buildings devoted to the cotton manufacture, averaging 700 spindles each, or 280,000 in all. The new mills were very large, the old ones quite small. Each spindle was supposed to consume one-half pound of cotton daily, or 140 pounds per annum. About one-third of the buildings employed power-looms, one-third hand-looms, and the balance spun yarn and twist for the southern and western States. Of these Massachusetts contained about 135, Rhode Island 110, Connecticut 80, New Hampshire 50, Maine 15, and Vermont 10. A convention of the Friends of Domestic Industry, held in 1831, gathered statistics from 795 cotton factories in twelve eastern and middle States, including Virginia, and had a record of thirty establishments in the southern and western States which made no accurate returns. The former aggregated a capital (principally fixed) of \$44,914,984, and operated 1,246,503 spindles and 33,506 looms. They employed 67,600 hands, besides 4,760 hand weavers, whose annual wages were \$12,155,723, and consumed yearly 77,757,316 pounds of cotton. They sold 10,642,000 pounds of yarn, and 230,461,990 yards and 59,604,926 pounds of cloth. The total value of the annual product was stated at \$32,036,760.

The official tables of the United States census for 1840 give the number of cotton factories in twenty-three States as 1,240, and the dyeing and printing establishments 129. The capital invested was \$51,102,359, and the number of hands employed 72,119, the number of spindles amounting to 2,284,631. The aggregate value of the product was \$46,350,453.

Within a quarter century after the introduction of the power-loom the cotton manufacture had attained the rank which it still holds as the first among the great branches of pure manufacture in respect to the value of the product, the amount of capital, and the number of persons employed in it. Its increase in the next ten years was in the ratio of upward of forty-two per cent., and in the twenty years preceding 1860 it was 150 per centum; population in the latter period having only increased 84.2 per centum.

Notwithstanding the great increase and present magnitude of the cotton manufacture of the United

States, amounting in value, as already stated, to \$3 68 per capita for the entire population, and in woven fabrics to thirty-six and one-half yards per head, or more than double the estimated average consumption of Great Britain, so universal is the use of cotton goods, and the ability to purchase in the United States, that the domestic manufacture falls far short of the demand. The average annual value of foreign cotton manufactures of all kinds imported into the United States from 1821 to 1839, inclusive, amounted to \$10,624,687, the highest amount having been nearly 18,000,000 in 1836, and the lowest about 6,500,000 in 1838. From 1840 to 1856, both inclusive, the average annual importation increased to \$16,795,418, the yearly exportation of the same averaging \$909,114. The average imports of the last three of those years was \$28,811,966. These values, during the later periods, consisted largely of piece goods from Great Britain, which has enormously increased her exports of cottons. Of plain white British calicoes alone our importations increased from 10,000,000 of yards in 1846 to 85,000,000 in 1856, and of printed or dyed calicoes, from 13,500,000 in the former to 97,000,000 of yards in the latter year. In 1860 we received from that country altogether 226,776,939 yards of cottons of the declared real value of \$3,849,915; but in the first two years of the war the quantity fell off to 74,680,537 yards in 1861, and 97,375,709 yards in 1862. The total value of cotton manufactures imported from all countries in the fiscal year ending June 30, 1862, was only \$5,254,258.

The total value of domestic cotton manufactures exported from the United States in seventeen years, from 1826 to 1842, was \$37,187,129, an average of \$1,187,478 per annum. From 1840 to 1856 the average yearly exportation of domestic cottons was \$5,008,772. The average annual home consumption of foreign cotton manufactures exceeded the average yearly value of domestic cotton goods exported by \$10,877,532, and only fell below it in one year, (1843,) when our export of domestic cottons was greater than our consumption of foreign cottons by \$578,794. The average annual exportation of American cotton manufactures and yarns in the five years from 1851 to 1855 was \$7,014,989. During the four years ending June 30, 1861, these exports were as follows: in 1858, \$6,333,833; 1859, \$5,467,525; 1860, \$7,539,532; and in 1861, \$6,816,453. In these last values Cotton Duck was included to the average annual amount of \$2,490,391, and Printed goods to the yearly average value of \$935,543. The exports of cotton manufactures in 1862 amounted to \$2,946,464. When it is remembered that the home consumption of cotton has never exceeded one-seventh of the entire crop of that material grown in the United States, and has generally been considerably less than that, and that its cheapness and excellent quality in times of peace give superior advantages to our manufacturers, we may hope that a branch of industry which employs so large a number of hands, and so much raw material, fuel, and machinery of American growth and production, which supplies annually many millions worth of cheap and comfortable clothing and furniture, and contributes so largely to the internal and foreign trade of the country, will show a large augmentation at the next national census, notwithstanding the unfortunate shock it has received during the war, now happily closed.

## INTRODUCTION.

xxi

Statistics of cotton goods produced in the United States during the year ending June 1, 1860.

STATES.	Number of establishments.	Capital in real and personal estate.	Pounds of cotton.	Value of raw material.	Number of spindles.	Number of looms.	Average No. of hands.		Annual cost of labor.	Annual value of product, 1850.	Annual value of product, 1850.	Increase per cent.	Number of yards of finished goods printed, dyed, &c.	Number of pounds of yarn and thread.	Number of pounds of batts, wadding, and wadding.

\*Decrease.

†Included in the above are 871,837,000 yards of printing cloths.

Number of seamless bays: Maine, 1,250,000; New Hampshire, 2,800,000; Massachusetts, 145,000; Connecticut, 730,000; New York, 1,310,000; Tennessee, 99,000 pounds cordage, &amp;c.

Aggregates of miscellaneous: Cordage, &amp;c., 4,876,977 pounds; quilts, 195,391 pounds; webbing, 450,000 pounds; table cloths, &amp;c., 11,000; quilts, 170,080; mosquito netting, 1,539,400 yards; coverlets, 11,590.

## WOOLLEN GOODS.

The woollen manufactures of the United States,\* in 1850, employed 1,817 establishments, distributed throughout thirty-two States of the Union. The aggregate capital invested was \$26,071,542; the cost of raw materials, \$24,912,455, and of wages, \$7,167,900. The hands employed were, 19,919 males, and 14,976 females. The value of woollen and mixed goods made in that year was \$43,542,288, and included the values of 82,206,652 yards of cloth, and of 4,294,336 pounds of yarn, excluding blankets, &c. On the 1st of June, 1860, the number of establishments employed on woollen goods (exclusive of worsted dress goods included in 1850) was 1,260. They represented a capital of \$30,862,654, and consumed 83,608,468 pounds of wool, and 15,200,061 pounds of cotton, employing 3,209 sets of machinery, costing, with all other materials, \$36,586,887. They gave employment to 24,841 male and 16,519 female hands, or 41,360 persons, whose annual wages cost \$9,808,254. The aggregate value of the product amounted to \$61,895,217. The articles produced were 124,897,862 yards of cloth, 6,401,206 pounds of yarn, 296,874 pairs of blankets, 616,400 long and square shawls, 18,000 table covers, 155,000 yards of felted cloths, and 600 coverlets.

From the following States there were no returns of woollen manufactures in 1850, viz: South Carolina, Georgia, Florida, Louisiana, Mississippi, Tennessee, California, and Oregon. From Arkansas, which in that year reported two factories, with a product of \$8,800, there was no return of woollens in 1860.

With a decrease of 557 in the number of establishments, as compared with the returns in 1850, doubtless in part occasioned by a more complete exclusion from the recent tables of such accessory and kindred branches as wool-carding and worsted mills, the aggregates show an increase of \$4,791,112, or 18.3 per cent. in the capital invested; \$11,674,432, or 46.8 per cent., in the expenditure for raw materials; 6,465, or 18.5 per cent., in the number of hands; and \$2,640,354, or 36.8 per cent., in the annual cost of wages, while the aggregate value of the manufactured product appreciated \$18,352,929, or 42.14 per cent., upon the returns of 1850. The gross proceeds of the manufacture, after deducting the cost of materials and labor, was \$15,572,367, or upward of fifty per cent. upon the capital employed to cover the interest on capital, the wear and tear of machinery, and various incidental expenses.

The consumption of wool amounted to an average of 2.66 pounds per capita for the entire population of the Union. It was in the proportion of five and one-half pounds to every pound of cotton used in the business. The quantity of cloth manufactured exceeded the amount returned in 1850 by 42,691,210 yards, or fifty-two per cent., and the weight of yarn was 2,106,870 pounds, or nearly fifty per cent. greater than in that year.

The product in cloth was equivalent to nearly four yards to each inhabitant of the Union, and in value averaged nearly two dollars (\$1 97) per capita. The average annual wages of each operative was \$237, or \$32 greater than in 1850; and the gross value of the product per hand was \$1,496, an increase of \$248 per hand. Each operative received on an average \$41 in wages more than was paid in the cotton manufacture, and produced annually an average value of \$542 greater than in the cotton branch. This disparity is mainly accounted for by the larger proportion of male hands employed in the woollen business. In this industry the male employés constituted sixty per cent. of the whole number, and in the cotton manufacture only thirty-eight per cent.

The principal seat of the woollen manufacture is in the New England States. Returns were made from 398 establishments in that section, many of them of large size. They reported an aggregate capital of \$18,753,453, and 14,840 male and 10,743 female operatives, whose labor cost \$6,144,847 per annum. They employed altogether 1,664 sets of machinery, or more than one-half of all in use in woollen mills in the Union. They carded and spun 57,819,930 pounds of wool, and 9,835,078 pounds of cotton, or nearly six pounds of wool to every pound of cotton. The total cost of raw materials was \$24,912,617, and for materials and labor together \$31,057,464. The value of woollens pro-

\* Exclusive of wool-carding and cloth-dressing, carried on as a separate branch of business, of carpets, hats, and hosiery.

duced was \$40,668,498, an increase of sixty-two per cent. upon the product of the same States in 1850, and only \$2,873,790 less than the value returned by the whole Union in that year. The gross proceeds of the manufacture over the cost of labor and material was \$9,611,034, or upward of fifty-one per cent. in the capital stock. This amount is materially reduced by the annual cost of repairs and other incidental expenses, by commissions, &c., and by no means represents the net profits of the business.

The New England factories produced the following articles, viz: 80,311,614 yards of cloth, 2,634,601 pounds of yarn, 198,287 pairs of blankets, 257,000 shawls, and 18,000 table covers.

The total value of the woollen manufactures of New England was about sixty-five per cent. of the aggregate for the whole country, and the several elements of the business, as the quantity and cost of material, number of hands, and cost of wages, &c., were nearly in the same proportion with the general aggregates. In value, the product was equivalent to nearly \$13 per head for each inhabitant of New England. Of cloth alone, the quantity averaged twenty-five and one-half yards to each inhabitant of New England, and two and one-half yards to each one in the United States.

Massachusetts was by far the largest producer of woollen goods. Returns were made by 134 establishments in that State, equal to about one-third of the whole number in New England. These were generally of large size, employing an aggregate capital of \$8,993,953, or nearly one-half the amount thus invested in that section of the Union, and an average of \$67,118 to each mill.

The total value of manufactures returned by the Massachusetts mills was \$19,655,787, an increase of \$6,874,273, or 53.78 per cent., over the product in 1850. The manufactories in that State employed 821 sets of machinery and 12,969 hands. They consumed 33,516,797 pounds of wool and 4,855,370 pounds of cotton, or 40,824 pounds of wool and 5,914 pounds of cotton to each set of machinery, and nearly seven pounds of wool to each pound of cotton. Each set of cards produced a value of \$23,341 on an average, and of cloth alone 42,508 yards. The product embraced 34,899,348 yards of cloth, 2,160,071 pounds of yarn, 57,207 pairs of blankets, and 157,000 shawls. The production of cloth was upwards of twenty yards per capita for the population of the State, and the total value of all descriptions of goods an average of nearly \$16 to each inhabitant. The Massachusetts mills produced more cloth and nearly as many blankets as all those of the middle States together.

The manufactures of Rhode Island ranked next to those of Massachusetts in this branch of production. They employed 57 establishments and \$3,168,500 in capital, which returned an annual product worth \$6,915,205. The machinery consisted of 253 sets of cards, and the number of hands was 4,223. The weight of wool spun was 6,832,600 pounds, and of cotton 3,056,200, equivalent to 27,000 pounds of wool and 12,080 pounds of cotton to each set of machinery, and nearly two and a quarter pounds of wool to every pound of cotton. The Rhode Island mills used a larger proportion of cotton than those of any eastern State, and one-fifth of the whole quantity consumed in the woollen manufactures of the Union. Its manufactures consist largely of satinets, linseys, kerseys, jeans, and negro cloths of cotton and wool. The quantity of cloths made was large, amounting to 19,343,600 yards, or more than half as much as was made in Massachusetts. The average quantity produced by each set of machinery was 76,457 yards. The total value of the woollen manufacture showed an increase of 176 per cent. upon its value in 1850. It averaged \$27,332 to each set of cards.

Eighty-four factories in Connecticut, with \$2,491,000 in capital, 265 sets of machinery, and 4,767 hands, produced 14,301,043 yards of cloth, and a total value in woollens of \$6,840,220. The increment on the product of 1850 was in the ratio of nearly 39 per cent.

In New Hampshire there were 51 woollen establishments and 146 sets of machinery; in Vermont 46 establishments and 99 sets; and in Maine 26 factories and 80 sets. In these three States were made upwards of 12,250,000 yards of cloth, besides other goods, valued altogether at upwards of \$12,500,000. The value of woollen goods made in these States severally was augmented in the following ratios, as compared with the returns of 1850, viz: in New Hampshire 21.57 per cent.; in Vermont 61.39 per cent.; and in Maine 83.46 per cent. New Hampshire held the fourth rank among the New England States in this industry, and the value of its woollens was \$5,782,641.

The woollen establishments of the middle States numbered 476, and ran 920 sets of machinery. The total capital invested in them was \$8,473,610. The number of hands was 11,638, of whom 7,098 were males and 4,540 females. The raw materials included 16,952,605 pounds of wool, and 4,943,183 pounds of cotton, and cost \$8,743,492. The cost of labor was \$2,720,711. The value of woollens produced was \$15,905,923, or 6.31 per cent. greater than in 1850, and upward of one-fourth the product of all the States in 1860. It exceeded the cost of materials and labor combined in the sum of \$4,432,075, which was equal to 52 per cent. upon the capital invested. The consumption of wool was about one-half as great as in Massachusetts, and the weight of cotton about one-half that used in all New England. The manufactures embraced 34,692,780 yards of cloth, 3,219,850 pounds of yarn, 57,437 pairs of blankets, 359,400 shawls, and 155,000 yards of felted cloths. The weight of yarn and the number of shawls returned by the mills in these States were greater, but the quantity of cloth and the aggregate value of woollens reported were much less than in New England. Pennsylvania was the principal producer of woollen goods in this section of the country, and ranked next to Massachusetts in the amount of capital invested, and in the value of the product. This State contained 270 woollen establishments, having \$4,339,310 in capital, 6,088 hands, and 483 sets of machinery. The weight of wool consumed was 7,128,529 pounds, and of cotton 4,337,000 pounds, which was in the proportion of one pound of cotton to 1.6 pounds of wool. This was a greater proportion of cotton than was used in any other State, and only about half a million pounds less than was consumed in Massachusetts. The value of the woollen manufactures of Pennsylvania was \$8,191,675, an increase of 45.51 per cent. over that of 1850. This included the values of 23,405,469 yards of cloth, 2,988,650 pounds of yarn, 42,347 pairs of blankets, and 110,200 shawls. Of the woollen machinery in that State 136 sets belonged in the city of Philadelphia, in which are a large number of woollen mills.

In the State of New York there were 140 woollen establishments, running 324 sets of cards, and consuming 7,453,004 pounds of wool, and 193,683 pounds of cotton. The consumption of wool was to that of cotton about as 38½ pounds to one, a greater proportion than was found in any northern State except New Hampshire, where only one pound of cotton was used to every 43.2 pounds of wool. As indicated by the relative proportions of the materials, the product embraced fewer mixed goods, and amounted in value to \$5,870,117, which was a depreciation of \$1,750,000 from the value returned in 1850. The woollens made were 7,951,679 yards of cloths, 230,000 shawls, and 6,000 pairs of blankets.

New Jersey, with 35 establishments and 61 sets of cards, augmented its manufactures of woollens in the ratio of 6.28 per cent., and Maryland, which had 27 mills and 44 sets of machinery, increased its product 89.8 per cent. in ten years. Delaware, with 4 mills and 8 sets of cards, showed a declension in the value of its woollens. The manufactures of New Jersey included 155,000 yards of felted goods.

The woollen manufactures of the western States employed 306 establishments and 466 sets of machinery, and a capital of \$2,129,991, employing 2,281 hands, whose annual wages cost \$577,812. They consumed 4,695,751 pounds of wool, and 170,700 pounds of cotton, (a proportion of 27½ to one,) which cost, with other materials, \$1,729,350. The value of the product was \$3,090,472, an appreciation on its value in 1850 in the ratio of 10.4 per cent. The manufactures consisted of 5,114,865 yards of cloth, 525,755 pounds of yarn, and 15,500 pairs of blankets. The State of Ohio contained much the largest number of establishments, (115,) with 173 sets of cards; but those of Kentucky, 37 in number, with 83 sets of cards, were larger and more productive. The value of woollen goods made in the latter was \$845,226, or \$20,000 greater than that of Ohio, which exceeded it in the quantity of yarn and blankets made, but produced less than half as many yards of cloth. In Ohio, Michigan, and Illinois, there was a falling off since 1850 in the value of woollen goods, while in all the others the rates of increase, though based on small amounts, were large. In Kentucky the ratio of increase was 429; in Indiana, 144.81; in Wisconsin, 417.59; in Missouri, 155.40; and in Iowa, 13.50 per centum, respectively.

From the southern States returns were made of 78 woollen mills, having an aggregate capital of \$1,356,600, and running 149 sets of machinery. They employed 1,079 male and 689 female hands, at an annual cost for wages of \$315,084. They spun 3,590,182 pounds of wool, and 251,100 pounds of

cotton. The whole cost of materials was \$1,123,828. The consumption of cotton was at the rate of one pound for every 14½ pounds of wool used. The total value of woollen goods made in these States was \$1,995,324, or 143.5 per cent. in excess of their production in 1850. The manufactures included 4,726,103 yards of cloth, 21,000 pounds of yarn, and 1,650 pairs of blankets.

Virginia took the lead in this industry, having 45 establishments, of which one-third were in the counties now included in West Virginia. They had a capital of \$463,600, and ran 50 sets of machinery, giving employment to 494 hands. The consumption of wool was 1,131,000 pounds, and of cotton 10,000 pounds, a proportion of 11½ pounds of wool to one of cotton. Its woollen products were of the aggregate value of \$717,827, and included upwards of 1,000,000 yards of cloth. Georgia, which ranked next to Virginia, had 11 mills and 30 sets of cards. Its product was valued at \$464,420, and consisted chiefly of cloths, of which it made more yards than Virginia. North Carolina came next, and had 7 factories and 23 sets of machinery. Alabama, the fourth in rank among southern States, had 6 mills and 14 sets of machinery, and showed the largest relative increase in its product of any southern State. It was followed by Mississippi and Texas, both of which added largely to the value of their woollen manufactures in the ten years preceding the eighth census.

Two woollen establishments, having 10 sets of machinery and 90 hands, and representing a capital of \$170,000, were reported from the Pacific States. Together they consumed 550,000 pounds of unwashed wool, costing \$77,600, which produced woollens to the value of \$235,000. The larger of these factories was in California, and, with 6 sets of cards, spun 400,000 pounds of unwashed wool, worth \$50,000. Its product was 18,000 pairs of blankets, worth \$150,000. The other mill was in Oregon, and, with 4 sets of cards, manufactured 52,500 yards of cloth, worth \$46,000, and 6,000 pairs of blankets, valued at \$39,000. These establishments have both come into existence since 1850.

#### HISTORY AND STATISTICS.

Our British ancestors are believed to have learned the use and manufacture of woollen clothing from their Roman conquerors, who, in common with several nations of antiquity, were well acquainted with it. The latter are said to have established a manufactory of woollen cloths at Winchester for the benefit of their imperial masters. Aided by the possession of a superior quality of native wool—that of England being regarded in early times as the best in the world, and down to the days of Elizabeth far superior to the Spanish—the woollen manufactures of England were by far the most valuable branch of the national industry, until surpassed by the extraordinary growth of the cotton interest towards the end of the last century and the beginning of this. It was encouraged by early and continued legislative measures. The exportation of wool and the wearing of foreign woollens was prohibited as early as the year 1261, and more effectually in 1660 by laws remaining in force down to 1824. The importation of wool was allowed free of duty in 1802.

The manufacture received its first impulse in the reign of Edward III, who, about the year 1331, wisely invited into England a number of Flemish weavers, dyers, and fullers of cloth, that people being among the most skilled in the art in Europe. A number of these, under John Kempe, established a manufactory in England. The article made was known as Kendal cloth or Halifax cloth. Blankets began to be made there in 1340, and in 1608 the art of dyeing was attempted. But half a century later much of the white cloth made in England was still sent to the continent to be dyed and dressed. A great improvement had been made in 1614 by the introduction of mixed or medley broadcloths made of colored yarns dyed in the wool. The encouragement of the woollen industry was deemed so important, that in 1678 a statute was made that all persons should be buried in woollen shrouds, which act remained in force 130 years. Ten years later the manufactures of wool were still further improved by fresh colonies of Flemings. About the close of that century Davenant estimated the value of woollen articles made in England of native and foreign wool at £8,000,000, the wool crop of the country being set down at one-fourth that value, or two millions sterling, and the value of woollens annually exported at a like sum. In the mean time the fine cloth manufacture had been successfully commenced, in 1646,

at Sedan, in France, followed in 1677 by the exclusion of British and Irish woollens from the French markets. Great Britain had also, in a measure, lost the sale of her woollens in Holland and Flanders, as the result of the restrictions and retaliations prompted by rivalries in trade, then so rife among commercial states. In this emergency England began to perceive the growing importance of her East Indian and American possessions, continental and insular, as a market for her manufactures. The production of woollen cloths in Ireland was restrained in 1698, and three years later their exportation from the island, except to certain ports in England, was wholly prohibited. In pursuance of the same policy, and to secure to herself the plantation trade in America, Great Britain, in 1699, prohibited, under heavy penalties, the exportation of wool or its manufactures in any shape from the English colonies in America. This act, which was among the earliest of those restrictive measures which afterward became a settled policy in regard to colonial industry, compelled the people to employ their wool in coarse but substantial household fabrics, but kept them wholly dependent upon the parent state for the finer products of the loom. This dependence has not yet ceased. Notwithstanding the unparalleled activity of our general industry, the United States is still the largest foreign consumer of British woollens, which for many years have constituted one-half or upward of our total importations of such goods. So great have been the improvements, and so extensive has become the manufacture of woollens in that country, that it gives her almost the control of the markets of the world. Soon after the close of the first war with America the woollen manufactures of Yorkshire alone were said to be greater than those of all England at the Revolution. The value of the woollen manufactures of the kingdom were stated by McCulloch, in 1844, to be about twenty-four millions sterling. The value of the same exported in the following year was £8,760,042. In 1859 the declared value of such manufactures, including worsted stuffs exported, was £12,053,708, and of woollen and worsted yarn £3,104,061. The annual consumption of wool is computed to be in the neighborhood of 360,000,000 pounds, of which amount about 250,000,000 pounds is the estimated product of 50,000,000 sheep in the United Kingdom in 1860, and the remainder of foreign and colonial growth. The importation of foreign and colonial wool in 1859 amounted to 133,284,634 pounds, of which upward of 53,500,000 pounds were from Australia. The exportation of sheep's, lamb's, and alpaca wool in the same year was upward of 29,000,000 pounds.

The first colonists of America naturally sought to shape their industrial system by that of the parent state, with such modifications as were suited to their altered circumstances. Such branches of husbandry and handicraft as were adapted to communities established remote from the source of supply became indispensable. Among these, sheep-raising and the production of woollen clothing and household stuffs were appropriate, on account of the characters of the soil and climate, which favored sheep husbandry, and rendered woollen fabrics necessary the greater part of the year.

Sheep were first introduced into these colonies at Jamestown, in Virginia, in 1609, at its first settlement. Forty years later they had increased to about 3,000 head. In 1640 there were about an equal number in Massachusetts, whither they were first sent seven years before. In 1676 it was written, "New England abounds in sheep." The Dutch also introduced sheep from Holland into New Netherlands in 1625, and again in 1630, but were not very successful with them. The Swedish colony on the Delaware had eighty sheep in 1663. The accidents to which flocks are liable in a new country were of course numerous, and prevented a rapid increase, notwithstanding that many local regulations and bounties were directed to that end. The breeds to which these early importations belonged are now unknown, but they were doubtless of different races. They became the progenitors of the present stock of common sheep, known as "native sheep," which, by continued admixture, probably contains the blended characteristics of the several originals, perhaps still further modified by crosses with the later importations of known and improved breeds. The wool of colonial flocks was certainly only adapted to the coarser purposes to which it was applied in the household manufacture of strong, plain fabrics for common wear. No attempts were made to improve the wool of the country by the introduction of fine-wooled sheep until the revival of industry after the war of the Revolution, when the "Society for the Promotion of Agriculture" in South Carolina, the first incorporated society of the kind in the United

States, chartered in 1785, at once offered, among other premiums, a medal for the first flock of sheep of the true Merino breed kept within the State. We have no account, however, of any importation until 1793, in which year the Honorable William Foster, of Massachusetts, smuggled from Spain, whose jealousy prohibited their exportation, three Spanish merino sheep as a present to a friend in Boston, who, in ignorance of their real value, duly converted them into mutton for his table. He was contented a few years later to pay \$1,500 each for such animals.

The first full-blooded stock ram actually kept in the country was probably one of four lambs sent in 1801 by M. Dupont de Nemours and M. Delessert, the latter a banker of Paris, at whose farms on the Hudson river the ram Don Pedro was successively kept until 1805, when he was purchased by Mr. Dupont and became the founder of some fine grade flocks near Wilmington, Delaware. E. J. Dupont & Co., in 1810, erected cloth works on the Brandywine, employing the merino wool of their own and neighboring flocks.

In 1802 the Honorable R. R. Livingston, the American minister at Paris, sent home to his farm in New York several pairs of French merinos from the government stock at Rambouillet, which he crossed with the progeny of Don Pedro. Later in the same year Colonel David Humphreys, of Connecticut, the minister to Spain, shipped to the United States a flock of 100 Spanish merinos, the greater part of which arrived safely, and a few years later furnished wool for an essay in the cloth manufacture by their proprietor. Two pairs of black Spanish merinos were also received the next year by Dr. James Mease, of Philadelphia, who had sent out orders several years before. Mr. Muller, of New York, imported several from Hesse Cassel in 1807.

The early importations of these gentlemen, to whom the country is much indebted for awakening interest in the subject, and the high price to which wool rose soon after, during the embargo and other commercial restrictions, turned public attention strongly towards wool-growing and the manufacture of wool. In 1809 and the two following years, William Jarvis, esq., of Vermont, then consul at Lisbon, purchased and sent to the United States upwards of 3,000 sheep of the choice breeds of Spain. These, with importations by other parties, amounting in all to about 5,000 head of merinos introduced up to this time, disseminated the breeds widely through Vermont and other New England and middle States, and even as far west as the Ohio. The price of merino wool rose from \$1 a pound, in 1807, to \$2, and even \$2 50, during the war.

Other fine-wooled sheep had also been brought to the country previous to the war, of which the "Merino Society of the Middle States," instituted in 1811, exhibited at its first show, in October of that year, specimens of the Irish, the Tunisian, or Barbary, the New Leicester, Bakewell, or Dishley, and the South Down breeds. Many of these have been skilfully bred, and other approved families, as the Saxon, (introduced in 1823,) French and Silesian merinos, &c., have been since introduced and distributed throughout the country. At present as fine sheep as any in the world are produced, especially in Vermont. Four prize medals were awarded to American exhibitors of wool at the London exhibition in 1851, and at the International exhibition in Hamburg in June, 1863. Vermont merino sheep took two first-class prizes, as having the heaviest fleeces and the longest wool of any of that class exhibited, although the choicest flocks of Europe were represented.

But, notwithstanding the attention given to wool-growing in several States, the large areas adapted to it in all, and its undoubted profitableness, our annual demand for home consumption is double the yearly product of our flocks, which in 1860 amounted to 59,673,952 pounds. In the twenty years preceding the war (1840 to 1861 inclusive) our total importations of foreign wool exceeded in value the exports, both of the home and foreign-grown article, in the sum of \$42,963,743, or nearly two millions annually. Much of this was the cheaper qualities of wool, especially from South America, and the tendency still is toward the manufacture of the coarser kinds, rather than fine wools. As a consequence, in part, of this deficiency of raw material, we imported, on an average, during each year of that period, upwards of nineteen millions' worth of manufactured wool, the aggregate amounting to \$429,422,951; and the exports in the same time to \$9,131,408. For the fiscal year ending June 30, 1862, our imports

of foreign wool amounted to 41,958,946 pounds, and in value to \$6,480,306, more than one-half of it from Great Britain and British possessions. The demand has been increased by the diminished supply of cotton and the large supplies of all-wool goods for the army and navy during the war. The manufacture of wool in America properly commenced with the first erection of fulling mills, in which woollen webs undergo a process which gives them body and thickness, and adapts them to receive a better finish, at the same time that it increases their durability. The first of these mills was erected in Massachusetts about the year 1648 by a society of Yorkshire people, who were among the first settlers in several of the States, and, being from the woollen districts of England, generally brought their looms and implements of trade with them, and thus introduced the arts of weaving and cloth-dressing where they settled. In 1645 laws were enacted in Massachusetts to encourage the propagation and preservation of sheep. In 1656 spinning was systematically enforced upon all classes by requiring every family, during thirty weeks of each year, to spin weekly three pounds of wool, cotton, or flax. The first weaver in Chelmsford, now a part of Lowell, was the same year granted thirty acres of land as an inducement to set up weaving in the place. Before the close of the seventeenth century the spinning, carding, and weaving of wool, and cloth-dressing had been introduced into each of the old colonies by successive emigrations of English and German artisans, and were encouraged or enjoined by various local statutes. Virginia, in 1662, offered five pounds of tobacco, which was its early currency, for every yard of woollen cloth made in the colony, and at the same time prohibited the exportation of wool. The transportation of sheep from that colony had been still earlier forbidden. In 1664 looms and weavers were established in each county by order of the general assembly, but we do not find mention of any fulling mills until 1692. A law to encourage textile manufactures in that province, enacted some eight years previous, was annulled in England as a contravention of the navigation act.

This last and other acts of Parliament which sought by bounties, &c., to induce the colonists to export naval stores and raw materials to England, and thus to dissuade from manufactures, showed the vigilance with which Great Britain fostered her hereditary industry, and, perhaps, at the same time, a well-grounded fear of the quick expedients by which her distant dependencies might supply their own growing necessities. The first suggestion to prohibit cloth-making in the colonies appears to have been in 1698, by Governor Nicholson, of Virginia, and was probably the occasion of the extraordinary act before referred to respecting the exportation of wool and its manufactures. Other royal governors gave similar counsels on the subject of this and other industries, and watched the development of the arts with a vigilance which showed the national jealousy of colonial manufactures.

Lord Cornbury, of New York, in 1705, mentioned a woollen manufacture then being set up in Connecticut and Long Island, and said it had produced serges that any man might wear. His successor, Governor Heathcote, in 1708, reported that three-fourths of the linen and woollen cloth worn were made in the country, and that he had felt it his duty to discourage a fine-cloth manufactory which had been talked of. A letter from New England to the Lords of Trade and Plantations, in 1715, declared that a considerable manufactory, still in existence, of stuffs, kerseys, linsey wooleseys, flannels, &c., had diminished the importations of the provinces £50,000 per annum.

In answer to inquiries instituted in 1731 respecting the cloth manufacture in the several colonies, it was stated that they consisted principally of linen and woollen cloths of a coarse kind made in families for their own use; that none were exported, and that in New England, where the greatest quantity was made, the manufacture had declined.

This household industry received a new and strong impulse through the non-importation agreements entered into just before the outbreak of the Revolution, when great efforts were made to increase the product of wool and other materials, and to promote household economy. In October, 1764, it was said that a company had established a woollen factory at Hempstead, Long Island, where broadcloths of any color could be supplied equal in quality and cheaper than any imported. A fulling and dyeing establishment was nearly completed also, at Jamaica. This attempt of some Yorkshire weavers to manufacture broadcloth did not succeed, probably for other reasons than the want of patronage, as it

was deemed patriotic to use articles of domestic product almost exclusively. In 1770 the graduating class at Harvard attended commencement exercises dressed in black cloth of New England manufacture. This was probably nothing else than the common domestic cloth made in nearly every family, and which formed the staple product of the country for ordinary wear. The woollens made consisted of two kinds: one a strong, coarse, all-wool cloth, three-quarters wide, which was sometimes fulled, but was often worn undyed and undressed; the other a kind called linsey-woolsey, made of linen warp and woollen woof.

Although the textile inventions of Arkwright and others were early adapted to the spinning and weaving of woollen fabrics in England, the British statute of 1750, prohibiting the exportation of tools and utensils used in the silk and woollen manufactures, under severe penalties, rendered it nearly impossible to obtain them. Few improvements were made, therefore, in the manufacture of wool, although an occasional attempt was made to produce fine cloth. Even the dressing of the common cloth in fulling mills of that day was performed imperfectly and with great labor. Gig-mills for teazles were scarcely used here up to the end of the last century. The price to farmers for fulling and dressing homespun cloth was forty to fifty cents a yard.

About the year 1788 a woollen manufactory was put in operation at Hartford, Connecticut, by Jeremiah Wadsworth and others, which in the course of a year made 5,000 yards of broadcloth, cassimeres, serges, &c., some of which sold at five dollars a yard. General Washington, who visited the factory in the following year, made his address to Congress in a suit of broadcloth presented by the owners; and many prominent gentlemen wore the gray-mixed cloths from that factory. A woollen manufactory set up at Stockbridge, Massachusetts, about this time, also made between five and six thousand yards of fulled cloth annually. In 1790 there was also a woollen mill at Watertown, and twenty-four fulling mills in the county.

In his report to Congress in 1791, Secretary Hamilton alluded to the extent of the household manufacture of woollens, and to the quality of the goods made at Hartford, surpassing anything that could have been looked for under the disadvantages. He speaks of the hat manufacture as the only branch of the woollen business which had reached anything like perfection, and of the importance of encouraging improvements in the breeds of sheep, as it was doubtful whether our wool was fit for the finer fabrics. In 1794, the first incorporated woollen company in Massachusetts established a woollen factory at Byfield, in Newbury, which was run by Arthur Schofield, and other English operatives, who had recently emigrated in company with Samuel Slater, the founder of the cotton manufacture in New England, to which use the factory was afterward converted. In 1804, Mr. Schofield, who had engaged in the construction of carding machines at Pittsfield, made the first fine broadcloth from merino wool probably made in the country. In 1807 Elkanah Watson introduced into Berkshire county, which has since become noted for its excellent cloth manufactures, the first pair of merino sheep from the Livingston stock, from the fleeces of which, in the following year, Mr. Schofield made a piece of blue cloth, superior to any yet made in the country. Samples were sent to the different cities, and accounts of it were published, with the cost of manufacture, and excited much interest throughout the country. He received at this time fifty to sixty cents a yard for weaving broadcloth.

In 1809 a company was formed at Pittsfield for the manufacture of fine cloth; and in 1812 Mr. Watson, founder and President of the Berkshire Agricultural Society, and a zealous promoter of improved manufactures, was awarded by the Society a prize of fifty dollars for a piece of broadcloth, deemed superior to any ever made in America, if not to any imported. During the same year the first cloth mill of any size in the country was erected at Pittsfield by L. Pomeroy, Esq. It employed only hand-looms, the first broadcloth power-loom not having been introduced there until 1825 or 1826, about which time the Pontoosuc Manufacturing Company commenced the manufacture of superior all-wool and cotton-warp drab and fancy broadcloths. That county at this time contains about twenty-four woollen mills, with 148 sets of cards.

The excitement on the subject of merino sheep, which carried the price of such sheep up to \$500,

and even \$1,500 each, extended also to the manufacture of merino wool, which rose from about \$1 a pound in 1807 to \$2, \$2 50, and even \$4 per pound in 1814, and cloth to \$18 a yard. It amounted to a mania with many, and led to injudicious investments, both in sheep-raising and the woollen manufacture, resulting in subsequent ruin to the parties. The New York legislature, in 1809, offered large premiums for the best narrow cloths made, both in families and in regular factories.

Secretary Gallatin's report, made in April of the next year, refers to fourteen establishments for the manufacture of wool, making each on an average annually 10,000 yards of cloth, worth from one to ten dollars a yard, all of it superior in quality, though inferior in appearance, to imported cloths of the same price. There were other establishments, from which no particulars were obtained, and some of the cotton factories also spun wool to a small extent. The principal part of the wool of the country which was deficient in quantity and quality was still made in families.

The official census of manufactures taken in 1810 made the number of yards of woollen cloth woven in families to be 9,528,266 yards, and the number of woollen factories twenty-four. The returns, however, were very incomplete, both as to product and machinery. The fulling mills numbered 1,682, of which 427 were in New York, and upward of 200 each in Massachusetts, Connecticut, and Pennsylvania. The number of yards of cloth fulled was 5,452,960, valued at \$4,117,308. A few wool blankets were made in Pennsylvania.

In Rhode Island there were twelve establishments for making cotton and woollen machinery. The principal woollen mills at this time were at Byfield, Massachusetts; New Ipswich, New Hampshire; Warwick and Portsmouth, Rhode Island; Derby, Connecticut; Poughkeepsie, New York; Philadelphia, Pennsylvania; Wilmington, Delaware; and Baltimore, Elkton, and Frederick, Maryland. Those at Derby, (the Humphreysville, incorporated this year with a capital of \$500,000,) Poughkeepsie, and Wilmington, (Dupont's,) used merino wool, and made broadcloth, some of which was also made at Baltimore and probably elsewhere. Cassinet (of cotton and wool) was made at Philadelphia.

In 1812 steam was employed by the Middletown Woollen Manufacturing Company, in Connecticut, and the Providence Woollen Manufacturing Company, in Rhode Island, the former of which was the largest manufactory of fine cloths and cassimeres in the country, making thirty to forty yards daily, worth nine or ten dollars a yard. Many patents had already been issued in the United States for shearing cloth by steam and water-power, and for other woollen machinery. Among these was one to Mr. E. Cobb, of Vermont, for a machine which enabled a workman to make twelve wool blankets in a day. Hand-cards had been long manufactured to a large amount, and had even been exported to England. Portable spinning-jennies, of ten to twenty threads, were becoming quite common in families.

The production of wool, estimated in 1810 on the basis of official returns at thirteen or fourteen million pounds, was computed in 1812 to be equal to twenty or twenty-two million pounds. Few countries had exhibited so rapid an improvement either in the quantity or quality of its wool in so short a time.

Factories for making army and navy cloths, blankets, and negro cloths, and especially fine cloths, sprung up everywhere, notwithstanding the high cost of material. Among these were establishments at Harmony, Pennsylvania; at Wolcottville and Goshen, Connecticut; and at Salem, Massachusetts, all of which used merino wool, and made broadcloths which sold readily at eight to twelve dollars the yard, but which thirty years later would not have been worth more than one dollar. Heavy importations followed the peace in 1815, amounting in the first three quarters of that year to upward of \$83,000,000, and for the next fiscal year to \$155,500,000, about \$70,000,000 of which was in woollens and cottons, paying under the act of 1789 an ad valorem duty of only five per cent.

To avert the destruction which threatened them, the woollen manufacturers appealed to Congress, representing that this branch employed a fixed capital of \$12,000,000 and 100,000 hands, (one-half of them constantly,) producing goods to the value of \$19,000,000. The business in Connecticut alone was stated to employ 25 establishments, which made annually 75,000 yards of narrow and 25,000 yards of broadcloth.

A duty of 25 per cent. ad valorem was accordingly laid, in 1816, on all woollens except blankets, rugs, and worsted or stuff goods. This was the rate until June 30, 1819, after which it was to continue at 20 per cent. The raw material was admitted duty free.

The manufacturers were also aided about this time by the introduction of the Power-loom, Messrs. F. C. Lowell, of Waltham, E. Savage, of Boston, and Messrs. Sheperd & Thorpe, of Taunton, Massachusetts, having severally brought forward loom engines near the same time, the last two particularly adapted to woollen fabrics. Such, however, was the strength of foreign competition that many factories, during the next six or eight years, were compelled to abandon the business, and others continued operations with heavy losses. Among the former was one started at Lexington, Kentucky, in 1814, for the manufacture of cloth, flannels, and blankets, which employed 200 hands, and was one of the largest and best supplied with machinery in the United States.

The census of 1820 furnished little available information respecting the woollen manufactures beyond the fact of its general depression.

Capital still continued to be invested in this business in the hope of a favorable change. In the State of New York sixteen manufacturing companies had been incorporated previous to 1823 for the manufacture of woollens exclusively, in addition to numerous private and unincorporated factories. Wool had fallen in price in 1824 to from 60 to 70 cents for fine, 42 to 45 for medium, and 31 to 33 cents for coarse. The deficiency of the domestic article was made up by considerable importations of Spanish, Saxon, and other wools. In May of that year Congress again raised the duty on imported woollens to 25 per cent. ad valorem on all (except flannels and baizes) which cost one-third of a dollar and under per square yard; and after June, 1825, a permanent rate of 33½ per cent. on all (except blankets and stuff goods) which cost over that price. Wool-growing was at the same time protected by a duty of 20 per cent. on unmanufactured wool, costing at the place whence imported over ten cents a pound, with a permanent rate after June, 1826, of 30 per cent., and on lower-priced wools, of 15 per cent.

The benefits of the latter act were in a great measure counteracted soon after by a reduction in England of the duty on foreign wool imported from SIXPENCE STERLING TO ONE PENNY, and afterward to a halfpenny a pound, avowedly for the purpose of placing British woollens in American markets at a cheaper rate. In 1827 the tariff was again revised with special reference to the relief of this industry, in which the manufacturers reported heavy losses. They claimed to represent a capital of \$50,000,000, or ten times the amount so invested at the close of the war in 1815. The Woollens Bill, as it was called, was, however, lost in Congress, which in the following year raised the duty on woollens to 45 per cent. on such as cost \$4 or less per square yard, and 50 per cent. on such as cost over that price. The high duty at the same time laid on the raw material was equivalent to 100 per cent. on low-priced wool costing eight cents a pound, which was largely imported, but not grown in the United States. The minimum valuation then first applied to woollens made the duties equal to specific rates of from 14 to 180 cents per yard on the five several grades enumerated. But it opened the door to fraudulent entries, and, together with the duty on wool, tended to neutralize the benefits of the act to the woollen interests. In July, 1832, low-priced wool was placed on the free list, and the ad valorem duty on other kinds was reduced ten per cent. The duty on low-priced woollen goods was also reduced to five per cent., but was raised again to fifty per cent. the next year, when provision was made by the compromise act for a gradual reduction of duties to a revenue standard of twenty per cent. after June, 1842. In the latter year the rate on woollens was readjusted at 40 per cent., to be again reduced in 1846 to 30 per cent., and in 1857 to 24 per cent. ad valorem. Under the act of June 30, 1864, cloths, shawls, and manufactures of wool pay 24 cents per pound, and 40 per cent. ad valorem, with an additional 5 per cent. on such as cost more than \$2 per square yard. Woollen and worsted yarns costing less than 50 cents per pound pay 16 cents a pound, and 25 per cent. ad valorem; if more than 50 cents, and not over \$1, 20 cents, and 25 per cent. ad valorem; and when above \$1, 24 cents, and 30 per cent. ad valorem.

A convention of the principal manufacturers of the United States, held in October, 1831, estimated the number of sheep in the United States to be 20,000,000, and their product in wool at 50,000,000

pounds. Its value, on an average of the three years preceding, was 40 cents a pound, or \$20,000,000, and when manufactured was worth \$40,000,000. The quantity imported in that year was 5,662,962 pounds. New York, which in 1825 had 3,500,000 sheep, was at this time supposed to have about 5,000,000, and to produce one-fourth of the total wool product of the country, while Massachusetts manufactured one-fourth of the same.

The sixth census returned the number of woollen factories in the United States on the first day of June, 1840, at 1,420, and the fulling mills at 2,585. The capital invested was \$15,765,124, the number of hands 21,342, and the aggregate value of the manufactures \$20,696,999. The largest producers in this branch were Massachusetts, New York, Connecticut, Pennsylvania, and Vermont, which together produced woollens worth \$16,750,000.

The value of woollens made in Massachusetts in 1832 was officially reported at \$6,500,000, those of Worcester county alone being nearly \$2,500,000. In 1837 the secretary of the commonwealth reported the value of woollen goods of all kinds made in Massachusetts to be \$10,399,807. They employed 192 mills, with a capital of \$5,770,750, and 501 sets of machinery, and 7,097 hands. The wool consumed was 10,858,988 pounds, and the quantity of cloth made 11,313,426 yards.

In 1845 the State census of Massachusetts made the woollen manufactures of the State to be of the value of \$8,877,478, the capital invested \$5,604,002, and the number of hands 7,372. This was exclusive of carpetings, worsted goods, hosiery, and yarns. The largest woollen establishment in the State, and the largest in the United States, was that of the Middlesex Manufacturing Company at Lowell, incorporated in 1830. It employed a capital of \$750,000, since increased to \$1,000,000, and about 1,500 operatives, and had two mills and two dye-houses. It ran 7,200 spindles, 37 broadcloth, and 122 cassimere looms, and used 1,000,000 pounds of wool and 3,000,000 teazles yearly, the product, being 119,000 yards of broadcloth and 624,000 yards of cassimeres annually. The next in extent in the country was that of the Messrs. Farnum, at Waterford, in Worcester county, who were among the earliest manufacturers of fancy and plaid cassimeres, and used upward of 1,000,000 pounds of the finest wool in their production and that of broadcloths.

In 1855 the product of Massachusetts in woollens had increased to \$12,105,514, the capital to \$7,305,500, and the number of operatives to 10,090. The number of woollen mills was 146, the sets of machinery 695, and the consumption of wool 18,786,298 pounds. Included in the product were 759,627 yards of broadcloth, valued at \$837,650; cassimeres, 6,444,585 yards, worth \$5,015,441; satinets, 6,736,082 yards, value \$2,708,935; Kentucky jeans, 1,948,609 yards, value \$31,000; flannels and blanketings, 10,279,227 yards, value \$3,125,949; and woollen yarn not made into cloth, 689,957 pounds, valued at \$386,537. Of the total value Worcester county produced \$3,994,697, or nearly one-third; Berkshire, Essex, and Middlesex being next in order. In 1860 Worcester county had 42 mills, and made woollen goods to the value of \$5,195,542, besides yarn.

Previous to 1855 the Bay State Mills, at Lawrence, Massachusetts, had become the largest in the world for the manufacture of cassimeres, shawls, and other fancy woollen goods, having the capacity to work up 2,000,000 pounds of wool annually. In 1850 they employed 2,200 operatives, 98 sets of carding engines, and 700 looms, with dye and print works for flannels and carpets. The products were plain and twilled flannels, dyed in fancy colors or printed, and in extensive demand, fancy casimeres and satinets, broadcloths, beaver cloths, all wool, long and square shawls, and felted goods, including beavers, linings, and carpets, made by a process peculiar to the establishment. The manufactory in extent and in the completeness and order of all its appointments was a type of the large woollen factories of New England. New York in 1855 contained 184 woollen factories for cloth and yarn, of which 161 used water and nine steam power, and the value of the product was \$3,392,207. There were in addition five shawl and blanket factories, two of them of large size, and five shoddy mills. The total consumption of wool was 10,877,783 pounds, and produced 4,836,834 yards of cloth, 506,178 pounds of yarn, besides shawls and blankets to the value of \$610,500, and shoddy goods worth \$41,640.

Pennsylvania, in 1850, had 258 woollen establishments, and the value of her woollen manufactures was \$5,629,550. In 1860 the mills numbered 270, the wool consumed was 7,128,529 pounds, and the cotton 4,337,000, which produced 23,405,469 yards of cloth and 2,988,650 pounds of yarn, valued with other articles at \$8,191,675. She produced more yarn than any other State, which is consumed by the hand-loom weavers and families of that and western States. Philadelphia has long been engaged in this industry, which was commenced by the English settlers on the banks of the Schuylkill, and, like the cotton manufacture of that city, still retains many of its early features. The business is characterized by the number of small independent factories, and the extent of hand-loom weaving, of which it is the principal seat in the United States. The products embrace all-wool and mixed cassimeres, in fineness and finish little inferior to the French, and often sold as such, satinets in large quantity, Kentucky jeans, twills and tweeds of a great variety of patterns and colors, which are in great demand at the west, all-wool and other shawls, and flannels, including an article called Welsh flannel, used by glass-blowers, miners, foundrymen, and kerseys or woollen plaids of various qualities.

The manufacture of superfine cloths has never obtained a permanent footing in the United States, although upwards of fifty mills, in 1845, made more or less broadcloth, some of it of fair quality. Recently its manufacture has been nearly or quite abandoned, except the production of army and navy cloths; although one factory in Hampshire and one in Worcester counties, Massachusetts, returned some broadcloth in 1860. This result is due in part to the quality of American wool, which, though equal in fineness to any in the world, is better adapted by its length of fibre for making soft woollen and worsted goods than fine cloths, which are improved in appearance by a shorter nap than can readily be imparted with native wool. The great and deserved popularity of the west of England superfine cloths, and the cheapness of all English broadcloths, produced by the cheap labor and perfect machinery now in use, the elegant finish of the French, and the lightness of French and German cloths, which adapt them to our summer use, have also prevented our manufacturers from obtaining possession of the home market under the low tariffs which have generally prevailed. American cloths have nevertheless been often sold in our cities as imported goods, to which in durability they are generally superior. Specimens of black cloth made from American fleece wool by S. Slater & Sons, of Webster, Massachusetts, were awarded prize medals at the world's fair in London in 1851.

The staple of our woollen manufactures at this time are plain and fancy, all wool and silk-warp cassimeres, doeskins, tweeds, habit cloths, beavers, flannels, blankets, balmoral skirts, shawls, satinets, negro cloths, and jeans, &c. In New England and New York the manufacture of cassimeres employs about 677 sets of machinery, that of satinets 364 sets, of blankets and flannels 369, of cotton warp cloths and carpets 113, of negro cloths and jeans 53, of feltings 44, and of shawls 43 sets.

American Shawls and Blankets from the Bay State Mills at Lawrence were adjudged prizes and medals at the exhibition of 1851, and specimens of shawls sent from the Watervliet Mills, New York, were considered not inferior to the best Paisley's. The Bay State Mill is the largest, and one of the earliest producers of these articles, particularly of shawls. A company was incorporated at Tariffville, Connecticut, in 1827, to manufacture carpets and shawls, but has chiefly produced carpets. In 1844 merino shawls were made in Philadelphia, and plaid or Rob Roy shawls at Washington, New York, and also good shawls at Skaneateles, in the same State. Good printed Terkeri shawls were made at Lexington, Kentucky, in 1849, at which date the Bay State Company employed in the business 1,000 hands, making daily as many long shawls, entirely of American wool. In 1860 shawls were made in five States to the number of 616,400, but chiefly in New York and Massachusetts. The Peace Dale Manufacturing Company in Rhode Island made 100,000 shawls in that year. Encouraging attempts have been made within a few years to acclimate the Cashmere and Angora goat in the United States, and machinery is said to be in course of erection at Lowell to manufacture fine fabrics from the fleeces of these animals, which supply the material for the costly Cashmere shawls. We still import shawls to a large amount annually.

Blankets and Flannels have been made for many years. Samples of white flannel from New York sold in Charleston, South Carolina, in 1822 for \$1 a yard, and was considered equal to the best Welch. Two years later, 30,000 pieces were made in and near Boston. In 1827 three mills in the vicinity of Newburyport made flannel to the estimated value of \$684,000. The first manufactory of the article in Vermont was established in 1829, at Barnet, by Henry Stevens. It was run by water-power, and was capable of making 3,000 yards weekly. In 1849 there were two flannel Mills at Dover, New Hampshire. The Bay State and Ballard Vale mills, and those of Gilbert & Stevens, at Ware, in Massachusetts, have produced flannels equal in softness and whiteness to any imported. The shawls, balmorals, fancy-made flannels and shirtings, opera cloakings, &c., made at Waterloo, New York, and Laconia, New Hampshire, are of acknowledged excellence. A manufactory of Mackinac or Indian blankets was established at Clintonville, near Buffalo, New York, in 1831, and one of cotton warp blankets for negro use about the same time in Pendleton district, South Carolina. The blankets made at Lawrence, Massachusetts, at Rochester, New Hampshire, and at Bridgeton, Maine, and elsewhere in the United States, have rivalled in beauty of texture and finish the best of foreign make. In 1860 blankets were manufactured to the number of 616,400, and to a greater or less extent in nineteen States; Maine, Massachusetts, New Hampshire, Pennsylvania, and California being the principal producers. Many blankets have been made by the Willamette Manufacturing Company, at Salem, in Oregon, the first established on the Pacific coast, the blanket factory in California being the next in those States. The late war created a large demand for coarse blankets and flannel for the army, as well as for other woollens, which was in part supplied by importations. Contracts were made in 1861 by a single manufacturer, near Philadelphia, to furnish the government with 431,000 yards of white and 271,000 yards of Indigo blue flannel. A few large factories have chiefly supplied army goods in the last year or two. The consumption of wool for military goods, purchased during the year ending June 30, 1862, was estimated by the Boston Board of Trade at 50,000,000 of pounds. Of that amount 30,000,000 of pounds were used for army cloths, (24,000,000 yards,) 13,000,000 for blankets, and 7,000,000 for miscellaneous purposes. The purchases included 1,281,522 overcoats, 1,446,811 uniform coats, 3,039,286 pantaloons, and 1,458,808 blankets. The purchase of blankets for the succeeding quarter year was 894,077. During the fiscal year named, we imported, in addition to woollen and worsted yarn, carpets, delaines, &c., 6,930,196 pounds of blankets, valued at \$1,945,707; woollen cloths, 4,432,392 pounds, value \$5,441,719; flannels, 92,642 yards, worth \$30,798; shawls, 49,882, valued at \$105,925.

Among the imports were 6,291,077 pounds of wool flocks, waste, or "shoddy," which has been much used in the manufacture of army and navy cloths and blankets in the United States, as it is in England. This article, which is the basis of an extensive trade centring in Batley and Dewsbury, in Yorkshire, is principally used in the manufactures of that neighborhood. It consists of cast-off woollen clothes, rags, stockings, carpets, and all soft woollen and worsted articles, reduced by powerful machinery to their original flocculent state, to be re-spun and woven, either alone or mixed with new wool, into a variety of fabrics. Hard, or superfine cloths, mechanically reduced to filament in the same way, produce what is called "mungo," which makes a better class of goods. Shoddy was originally only used for padding; but for some years past has been used for the manufacture of pilot and petersham overcoats, table and piano covers, army cloths, &c. White shoddy enters into light-colored goods, blankets, &c., and the dark-colored into carpets and coarse cloths of all kinds, which are dyed to cover the original colors. Mungo is extensively used in the production of the cheap Yorkshire broadcloths, which, in finish and appearance when new, are little distinguishable from the best west of England cloths. These shoddy cloths, on account of their cheapness and deceptive appearance, have been very much used in the United States, to the injury of our cloth manufactures. Being, in some respects, better adapted to produce a close, short nap than American wool, this material has also entered into our domestic manufactures of late years. The machines for reducing rags to shoddy are also in use here. About the beginning of the current century a machine was patented by a Philadelphia manufacturer for that purpose, and about four years later an essay was made in that city to manufacture the material

# INTRODUCTION.

XXXV

from rags and refuse woollens. A shoddy mill was projected in 1842 at Woodstock, Vermont, by a Mr Stearns, who proposed to manufacture satinets from the filament of soft woollen rags. There are shoddy mills in several States at this time. Five mills in New York in 1855 employed 58 hands, and materials valued at \$13,900—their product \$41,640. They were at Newburgh, Watervliet, Troy, and Marlborough.

## WORSTED GOODS.

The manufacture of worsted goods, consisting chiefly of all-wool and cotton warp, mouseline de laine, bareges, Cashmeres, &c., for ladies' dresses, is mainly carried on in three establishments in the United States. These are the Manchester Print Works in New Hampshire, the Pacific Mills at Lawrence, and the Hamilton Woollen Company's Works at Southbridge, in Massachusetts.

These manufactories had invested in this branch in 1860 a capital of \$3,230,000. They employed 110 sets of cards, and 1,101 male and 1,277 female hands, whose aggregate yearly wages amounted to \$543,684. The raw materials were 3,000,000 pounds of wool, worth \$1,554,000; 1,653,000 pounds of cotton, costing \$196,640; besides madder and other dyestuffs, coal, oil, &c., costing altogether \$2,442,775. The cost of wool was 51 cents, and of cotton 11.8 a pound, on an average of the whole quantities. The aggregate product was 22,750,000 yards of de laines, &c., valued at \$3,701,378.

The average annual wages of operatives was \$228. The product was in the proportion of 206,818 yards of cloth, and \$33,648 in value, for each set of cards employed. The average value per yard of the goods was 16.20 cents, the cost for labor and material being 13.12 cents a yard. The largest of these establishments was that of the Manchester Print Works Company, which employed a capital of \$1,200,000, and ran 58 sets of cards. It expended for the wages of 395 male hands \$118,500, and for that of 675 females \$133,500, an average of \$300 per annum for each male, and \$197 for each female operative, and a total of \$252,000 for the yearly labor of 1,070 persons. It consumed 1,560,000 pounds of wool, valued at \$780,000; and (by estimation) 772,000 pounds of cotton, worth \$92,640; and for other raw materials paid \$254,335, making the total cost of materials \$1,126,975, and of labor and materials together \$1,378,975. The manufactured goods amounted to 9,500,000 yards, of which the value was \$1,700,000. Each set of cards required on an average 26,896 pounds of wool and 13,310 pounds of cotton annually, and produced 163,793 yards of cloth, at a value of \$29,310. The average cost of wool was 50 cents, and of cotton 12 cents a pound, and the value of the goods made was 17.99 cents a yard.

The Pacific Mills at Lawrence, incorporated in 1853, apart from their production of cotton goods, employed one mill in the manufacture of worsted fabrics, with a capital of \$1,430,000. Its machinery consisted of 30 sets of cards, 31,000 spindles, and 800 looms, driven by water-power. It gave employment to 435 men and 365 women, the annual wages of the former amounting to \$120,000, or \$275 each, and of the latter to \$54,000, or \$148 each, making the total cost for the labor of 800 persons \$174,000 per annum.

The raw material consumed was as follows: wool, 850,000 pounds, worth \$450,000; cotton, 576,000 pounds, valued at \$64,000; madder, 2,000,000 pounds, costing, with other dyestuffs \$300,000; anthracite coal, 4,500 tons, cost \$25,000; and oil to the value of \$8,000; total value of raw materials \$847,000. The mill produced 8,250,000 yards of cotton and worsted de laines, and dress goods valued at \$1,250,000, which was \$229,000 more than the combined cost of labor and materials. The average consumption of wool for each set of cards was 283,333 pounds, and of cotton 192,000 pounds. The total product averaged 275,000 yards of cloth, and a value of \$41,666 to each set of cards. The consumption per spindle averaged  $27\frac{1}{2}$  pounds of wool and  $18\frac{1}{2}$  pounds of cotton, and the manufactured product 266 yards of cloth to each spindle, and 10,312 $\frac{1}{2}$  yards to each loom. Wool cost the company on an average nearly 53 cents a pound, and cotton 11.1 cents. The manufactured goods cost for labor and material 12.37 cents a yard, the value when made being 15.15 cents per yard.

The Hamilton Company's mill at Southbridge employed in the textile branch of its business a

capital of \$450,000, and in printing, \$150,000. It ran 22 sets of cards, 18,000 spindles, and 432 looms by water-power, steam and water being used in the printing. The male hands employed numbered 271, and the female 237, of whom 136 males and 222 females belonged to the spinning and weaving, and the balance to the printing departments. The total annual wages of these operatives cost \$117,684, the male hands averaging \$300, and the females \$153 each per annum. The materials wrought were 590,000 pounds of wool, costing \$324,000, an average of nearly 55 cents a pound; 305,000 pounds of cotton, worth \$40,000, or 12.3 cents a pound; and 4,800 gallons of oil, worth \$4,800, in addition to dyestuffs, valued at \$100,000, making the total cost of raw material \$468,800, and of labor and material together \$586,484. The product was 5,000,000 yards of *de laines*, &c., valued at \$500,000, to which was added in the printing a value of \$251,378, making the total value \$751,378. The value of the manufacture over the cost of labor and material was \$164,894, or 3.7 cents a yard on goods which averaged, when finished, 15.02 cents a yard.

The consumption of wool in their manufacture was at the rate of 26,818 pounds to each set of cards, and 32.8 pounds to each spindle, and that of cotton averaged 13,854 pounds to the card, and 17 pounds to the spindle. Each set of cards produced 227,272 yards of worsted goods, and an average value of \$34,153. Each spindle averaged 277 yards of cloth, and each loom 11,574 yards.

The capital of the two mills in the State of Massachusetts was \$2,030,000; the number of hands, 1,308; the sets of cards, 52; spindles, 49,000; looms, 1,232; consumption of wool, 1,440,000 pounds worth \$774,000; cotton, 881,000 pounds, worth \$104,000; total value of all materials, \$1,315,800; total cost of labor, \$291,684; yards of cloth made, 13,250,000; value of the same, \$2,001,378.

The goods manufactured in these establishments are chiefly all-wool and cotton-warp *de laines*, challies, bareges, imitation bareges, all-wool and part-wool reps and worsted yarns for carpets and hosiery. They are good fabrics, woven by power, and of different qualities; the gray *mousseline de laines* of the Manchester Company were formerly made with No. 37 cotton warp and No. 40 wool filling for the coarser kinds, and the finer qualities were made with No. 70 cotton warp spun on the Potter mule, and No. 50 woollen weft made on the Smith mule. Many improvements have been made in this interesting branch of our manufacture, particularly in the printing department.

The wholesale prices of American *de laines* in New York, on February 1, 1865, were, for those of Pacific Mills, 42 cents; Hamilton, 32 cents; and Manchester, 33 cents a yard, which was a decline from the previous quotations.

The largest establishment is the Manchester mill, owned by the Merrimac Mills Corporation, which also manufactures cotton print goods extensively. This mill in 1849 contained 22,000 spindles and 600 looms, and employed 1,000 hands, making 5,200,000 yards of *de laines* and print cloths. These were printed in tasteful patterns and brilliant colors. In a single week, ending June 4, 1853, the company made 422,389 yards of plain gray *de laines*, 7.44 yards to the pound.

The manufacture of worsted goods, or goods of which worsted was a component part, employed ten establishments and 846 hands in Massachusetts in 1845. These produced 2,321,338 yards of woven goods, worth \$382,858, and 617,360 pounds of yarn, valued at \$271,708—total value, \$654,566.

Very good styles of *mousseline de laines*, alpacas, and Orleans cloths were at that time made by the Ballardvale Manufacturing Company, at Andover, and 350,000 pounds of worsted yarns and 3,000 pieces of bunting, in addition to other woollens, by the New England Worsted Company, at Saxonville, in that State. The last-mentioned article was first made in the United States a short time previous to this at Framingham, where, in 1844, about 500 yards were made daily, of a quality thought equal to the foreign. The manufacture of bunting, however, has never been successfully established in this country heretofore. Quite recently, we believe, during the late rebellion, it has been resumed at Lowell, and there is every probability we shall be no longer dependent on foreign looms for that article.

The Massachusetts State census of 1855 gives the number of mills employed on worsted and mixed goods as seven, and the number of hands 1,062. Their united capitals amounted to \$1,236,000,

and the value of their manufactures to \$1,448,740. The quantity of cloth made was 8,189,930 yards, valued at \$1,029,284, and of yarn not woven into cloth, 1,023,900 pounds, worth \$419,456. The Hamilton Company at that time made a return of 4,500,000 yards of de laines printed, of which the value was \$675,000. They employed 18 sets of cards and 9,000 spindles, and consumed 540,000 pounds of wool, which made 4,400,000 yards of cloth, worth \$440,000. The Pacific Mills then ran 13 sets of woollen machinery in connexion with their print works, and made 3,216,998 yards of de laines, valued at \$536,000. These consumed 475,000 pounds of wool and 200,000 pounds of cotton. There were small factories at Canton, Chelmsford, Framingham, and Lowell, and one at Sudbury, which made no return. Fancy worsted goods to the value of \$20,000 were made at Canton, cashmerets at Chelmsford, and a small quantity of silk and worsted coach lace by one mill in Worcester county. The others chiefly produced yarns.

Worsted felt beavers, and other worsted felt goods, made without spinning or weaving, by incorporating together successive layers or thin sheets of worsted, are made by the Union Manufacturing Company, at Norwalk, Connecticut. The process is altogether an American one, we believe.

The printing of worsted goods was commenced in Rhode Island nearly on the first introduction of this class of goods. On the first of February, 1840, it is said \*a new pattern of French mousseline de laines was opened in New York by an importer, who offered the goods at 14 cents a yard by the case. On the following day the agent of a Rhode Island calico print works forwarded to Providence a sample of the new style, and in sixteen days had the same style of goods, and of equal fabric, in New York, selling at ten cents a yard. In twelve days the new pattern had been engraved on a copper cylinder, transferred in relief to a steel cylinder, hardened, and ready for use; the proper coloring ingredients discovered by chemical experiments, and the goods printed, dried, and cased for market.

The Dunnell Manufacturing Company, at Pawtucket, probably the oldest and one of the largest print works in the country, have, in addition to calicoes, printed large quantities of de laines, bareges, &c., both in steam and madder colors, their establishment being arranged to effect greater economy than European establishments generally. Beautiful styles of cashmere de laines were printed at Lodi, New York, in 1850, by Robert Rennie. Many de laines, merinos, and other French cloths are imported in an unfinished state and printed in colors and patterns to suit the market at the Philadelphia Print Works. Handsome de laine prints have also been produced by the American Print Works and Bay State Mills, at Fall River, Massachusetts. But the large New England companies, who print chiefly their own manufactured goods, have produced every variety, and in styles and colors unsurpassed by any imported.

The Hamilton Company, and others, have produced, with great success, cashmeres, de laines, &c., printed by machinery with copper "shells," in handsome landscape patterns, in which birds, castles, trees, flowers, &c., are brought out with great distinctness and beauty. The large and more showy patterns, with many and vivid tints, are chiefly sold at the south and west. The madder color prints, which are in demand in the New England and northern States, are admired for the sobriety and harmony of their colors and the beauty of the designs. The Pacific Mills have recently introduced printing machinery—said to be used only in one other place in the world—which prints sixteen different shades and colors in passing the fabric once through it.

The duty on worsted goods was laid, in 1842, at 30 per centum ad valorem. In 1846 it was reduced, except on shawls of worsted and silk, to 25 per cent., and in 1857 to 19 per cent., shawls of worsted and silk paying 24 per cent. Under the present tariff gray or uncolored dress goods for women and children, composed wholly or in part of wool, worsted, alpaca, or goat's hair, &c., pay, when costing not over 30 cents the square yard, 4 cents per square yard, and 25 per cent. ad valorem. When exceeding in value 30 cents per square yard, the duty is 6 cents a yard and 30 per cent. additional, with an additional 5 per cent. ad valorem on stained, colored, or printed goods. Balmorals and like goods pay 24 cents a pound, and 35 per cent. ad valorem, and bunting and all other manufactures of worsted, alpaca,

\* *Hunt's Merchants' Magazine.*

mohair, &c., 50 per cent. ad valorem. Worsted yarn costing over \$1 per pound pays 24 cents a pound, and 30 per cent. ad valorem, and cheaper kinds 16 and 20 cents per pound, and 25 per cent. ad valorem

*Statistics of worsted goods produced during the year ending June 1, 1860.*

### HOSIERY.

The manufacture of hosiery includes the production of a variety of articles, such as stockings, socks, gloves, mittens, drawers, under-waistcoats or shirts, jackets, opera hoods, shawls, scarfs, comforters, night-caps, and other plain and fancy and knit goods, of whatever color, whether made of wool, cotton, silk, or flax, or of those materials combined, and either knitted by hand or woven on the stocking loom. Though not heretofore a business of much extent in the United States as compared with its magnitude in Great Britain and Germany, it is one of growing importance, and was largely augmented in the ten years preceding the last census.

In 1850 three New England, four middle, and three western States made returns of this industry which showed an aggregate of eighty-five manufactories, having a capital of \$544,735, an expenditure for raw material of \$415,113, and 835 male and 1,490 female hands, the cost of whose labor was \$360,336, and the annual product \$1,028,102. Upwards of one-half the product, or \$561,577, was returned by Pennsylvania, which had fifty-nine establishments, employing altogether 1,237 hands. Probably the largest manufactory was in Connecticut, which reported only one, the capital of which was \$200,000, and the yearly product \$222,000.

The statistics of this branch of industry in 1860 embraced returns from four eastern, four middle, and three western States. The total number of hosiery establishments in these was 193. Their united capitals amounted to \$4,035,510; the value of raw material to \$3,202,317; number of hands employed, 2,780 males and 6,323 females; cost of labor \$1,661,972; and the value of manufactures \$7,280,606. They consumed 2,927,626 pounds of wool and 3,892,342 pounds of cotton. The value of the product exceeded that of 1850 by 608 per cent. In the eastern States the product was increased in ten years from \$408,000 to \$2,374,242, or 481 per cent.; in the middle States from \$609,402 to \$4,847,984, equal to 695.5 per cent.; and in the west from \$10,700 to \$58,380, equivalent to 445 per cent.

The middle States manufactured hosiery to more than double the value made in New England, the largest producer being Pennsylvania, in which it amounted to \$2,114,315, or nearly as much as that of all New England, and an increase of 276 per cent. upon the production of that State in 1850. The ratio of increase was large in all the States which made returns. Wisconsin, which in 1850 made \$500 worth, made no return in 1860. It was greatest in New Jersey and New York, the former of which returned the value of \$783,456 against \$9,100 in 1850, and the latter \$1,944,090, a very large increase on the product of 1850, when it was only \$37,000. Connecticut was the largest manufacturer of hosiery in New England, and returned a value of \$1,383,528, an increase of 523 per cent., while Vermont, which reported none in 1850, made to the value of \$102,800. The increase in the other States was at the following rates, viz: New Hampshire, in which the production exceeded half a million dollars, 379 per cent., Massachusetts 373, Maryland 255, Ohio 278, and Missouri 726 per cent. Connecticut made a return of 159,610 dozens of shirts and drawers, 64,500 dozens of hose, and 112,000 yards of stockinet. Maryland reported 4,060 dozens of hose, valued at \$6,123.

## HISTORY AND STATISTICS.

The present extended manufacture and use throughout the world of knit fabrics and of lace illustrate the far-reaching influences of a single useful invention. The use of *hose* or leggings, comprising in one piece all the covering below the waist, probably originated in the middle ages of Europe. The hose was afterward separated into breeches and stockings, which last, in the early part of the sixteenth century, was chiefly made of milled cloth even for the use of royalty itself. It is not known precisely when or where the art of knitting stockings originated; but a company, or guild, of stocking weavers is said to have been established in Paris in 1527. Knit worsted stockings are also said to have been made in the Pyrenees for centuries; and stocking-frames a few years ago were not allowed by the French government to be erected there lest they should interfere with the ancient industry. Henry II, in 1559, is believed to have been the first French sovereign who wore silk stockings. Knit hose were in use and probably were made in England in 1533, although the King, ordinarily, wore cloth hose, unless, by great chance, a pair of silk stockings came from Spain, whence the use and perhaps the art of making knit hosiery appears to have been brought. The presentation of "a pair of long Spanish silk stockings" to Edward VI by the eminent merchant, Sir Thomas Gresham, is noticed as a "great present." In 1560 a pair of black silk stockings knit in England was presented to Queen Elizabeth by her silk woman, Mrs. Montague, from which time the Queen refused to wear cloth hose. The first pair of worsted stockings known to have been knit in England were soon after made in imitation of a pair from Mantua, and presented to the Earl of Pembroke. Knitting, therefore, became a common occupation of the rural and humble classes, and Shakspeare speaks of

"The knitters in the sun,  
And the free maids who weave their thread with bones."

Knitting became also a fashionable employment with ladies of rank. The Shetland Isles, which were famous for their fine wool, became celebrated for the beauty and excellence of their knit fabrics, and it is said that a lady of these islands, at a later period, knit a pair of stockings of such fineness as to be drawn through her finger-ring. They were presented to George IV, and displayed by him with pride at his levees.

The common broad stocking-frame, or loom, for knitting plain hosiery, which, throughout Europe, soon superseded knitting by hand, and became the groundwork of all subsequent improvements, was invented by the Rev. William Lee, of Woodborough, near Nottingham, about the year 1589. This remarkably ingenious but complex and cumbersome machine was the result of several years of intense toil and study. It was first set up at Culverton, near Nottingham, where the inventor, in 1697, had nine machines in successful operation. It was afterward carried to London and operated before the court, but failed to secure the patronage of the aged queen, or of her narrow-minded successor, James I, who either did not perceive its future importance to his subjects, or feared the innovation would be dangerous to the poor hand-knitters. Henry IV of France, or his enlightened minister, Sully, was more sagacious, and by his invitation Lee transferred his machines to that country and established his manufactory at Rouen with success. After the assassination of his royal patron in 1610, Lee was forced, by religious persecution, prompted by jealousy, to abandon his new field and go into concealment in Paris, where he afterward died in poverty and disappointment. One of his apprentices named Aston, escaping to England, remounted the stocking-frame and once more established the hosiery manufacture in Leicester and the neighboring counties of Nottingham and Derby, where it has ever since flourished. In 1663 the Frame Work Knitters' Company, of London, was granted a charter by Charles II, which had been refused them by Cromwell; and in 1696-7 the exportation of stocking-frames from the kingdom was prohibited on pain of forfeiture and a fine of £40. In 1781 the penalty for exporting machinery was made much more severe, which rendered it difficult for Americans to obtain it.

Though little improved during the first century after its invention, the stocking-loom, which required two men to work it, yet enabled English manufacturers to export large quantities of silk hosiery even to Italy, and as late as 1730, silk stockings at Naples were sufficiently recommended if they were called English. In 1758 Mr. Jedediah Strutt, of Derby, the manufacturer with whom Samuel

Slater acquired a knowledge of the cotton business, which he afterward introduced into the United States, succeeded in adapting the stocking-frame to the manufacture of ribbed or striped hosiery, similar to that knit by hand. This was effected by a slight addition to the mechanism, whereby the plain and ribbed courses were wrought separately by reversing the loops of a single thread, as tweeling is effected in cloth weaving by reversing the two kinds of yarn to make dimity, kerseymere, and other striped or tweeled fabrics. About the same time the cotton spun on the water-frame of Sir Richard Arkwright, at Nottingham, afterward the partner of Strutt, was found to be admirably adapted to the stocking manufacture on account of its evenness, being made of two roves instead of one, and hence called double-spun twist. The first product of the water-frames was, therefore, all devoted to stocking-making, and twist supplied the place of hand-spun thread for that purpose. About the year 1768 the stocking frame was applied by Hammond, a frame-work knitter of Nottingham, to the manufacture of lace, which, like hosiery, had long been made exclusively by hand. Lace-making has since developed a series of valuable inventions appropriate to itself; but the stocking-frame of Lee was the basis of them all.

Upwards of thirty years ago the number of different machines—some of them in use, others disused, and all of them improvements or modifications of previous inventions—applied in England to the manufacture of hosiery and lace, amounted to about one hundred. The whole number of knitting-frames employed in the hosiery trade in Great Britain in 1835 was 33,000, and the number of persons 73,000. The product was 3,500,000 dozens, the value of which was £1,991,000. This was independent of the value of hosiery wrought by wires, and was considered by Mr. McCulloch an understatement of the real value, being only equivalent to 2s. 5d. a year to each inhabitant in Great Britain. The value of cotton hosiery was £880,000; that of worsted, £870,000; and that of silk, £241,000. The number of frames in use at this time is estimated at not less than 50,000, of which more than one-third are in Nottingham, giving employment to 40,000 persons. In Leicestershire about 35,000 persons are employed, in addition to those in Derby, and several parts of Scotland, where a single town—Hawick on the Teviot—produces one and a half to two million pairs annually.

The quantity of woollen and worsted hosiery and stockings exported from the United Kingdom in 1820 was 59,960 dozen pairs; in 1830 it was 111,136 dozen; and in 1835, 207,014 dozen, chiefly made in Leicester. Of the last-named quantity, 141,246 dozen were shipped to the United States. Silk hosiery is principally made in Derby and Nottingham, and cotton hosiery in Nottingham and Derbyshire, and at Hinckley and Tewkesbury. Of the latter description of goods, including lace and small wares, the exports to all countries in 1835 were valued at £1,240,284, and to the United States at £327,910.

The date of English colonization in this country was nearly coincident with the first use of knit hosiery, at least in the parent country. It would scarcely have surprised us to find no mention in our earliest annals of an article of clothing which, though now worn by the very poorest, was at that date certainly not possessed by one in a thousand, and which, probably, within the lifetime of the first colonists, was only worn by the nobility when they appeared at court. Yet, among the articles of outfit provided in 1629 to be shipped to New England we find mention of 800 pairs of stockings, 200 of which were to be Irish, at 13d. a pair in Dublin, and 100 pairs of *knit*, at 2s. 4d. a pair; also "500 pair of redd knit capps, milled, about 5d. apiece." These articles are included in the same invoice with "sutes of dublett and hose of leather lyned with oyled-skin leather, ye hose and dubletts with hooks and eyes," and with "breeches" or "leather drawers," &c.,\* which at that time, and for many years subsequently, were a much more common article of apparel than knit hosiery.

Though mainly dependent upon importations from England, the early colonists encouraged the household manufacture of their own wool into stockings with such effect as to produce large quantities of coarse woollen hosiery. Much of the wool in colonial times was spun as worsted—that is, with a double thread—and was used for knitting. In 1662 the assembly of Virginia decreed a premium of ten pounds of tobacco for every dozen pairs of woollen or worsted stockings. In 1775, when schemes for independence were rife, the same province offered £50 for every 500 pairs of men's and women's stockings produced, and worth from 1s. to 3s. a pair, with the privilege of buying them at an advance

\* Felt's Annals of Salem, vol. 1, p. 49.

of 75 per cent. on those prices. The Dutch and German settlers of New York and Pennsylvania excelled in this branch of household industry. Stockings of red, blue, or green worsted were among the articles which a thrifty Dutch matron was proud to display beside her stores of bleached homespun linen. We are told that knitters of coarse yarn stockings in Pennsylvania, in 1698, received half a crown a pair. The German Palatines who about that time settled at Germantown, in that State, established the hosiery manufacture at that place, which has ever since taken the lead in the manufacture, particularly of frame-knit goods of cotton, thread, and worsted. Germantown hosiery became an attractive feature of the semi-annual fairs established by William Penn in Philadelphia, which drew visitors from neighboring States, and it was always to be found on sale in the market-house in the city. Previous to the Revolution the manufacture was essentially a household one, and embraced only coarse articles of ordinary wear. Occasionally, indeed, silk stockings were knit in families from imported or domestic silk. Governor Law, of Connecticut, in 1747, is said to have worn the first coat and stockings of New England silk, which was so successfully cultivated at Mansfield, in that State, that a company was incorporated in 1788 to make silk cloth, and stockings, handkerchiefs, ribbons, buttons, sewings, &c., were made at a good profit.

Frame-work knitting appears to have been introduced into this country before the Revolution, either by the Germans of Pennsylvania or by English artisans from Nottingham and Leicester, many of whom settled in New York and other eastern and middle States. The earliest mention we find of stocking-weaving is in 1723, when one Matthew Burne, of Chester county, Pennsylvania, is mentioned as having served John Camm one or two years at stocking-weaving, during which time Camm's stockings obtained some repute.\* Mention is also made of a stocking manufactory at Annapolis, Maryland, about the year 1747, which was regarded as a great curiosity, but did not succeed. In 1776 the committee of safety in that State appropriated £300 to enable M. Coxenderfer, of Frederick county, to establish a stocking manufactory. A society of arts established in New York in 1764 offered, among other premiums, £16 and £12 for the two largest quantities of three-thread wove stockings made in the province during the ensuing year. In March, 1766, the same society proposed a premium of £10 for the first three stocking-loom of iron set up during the year, and £5 for the next three, and £15 for the first stocking-loom made in the province. It also continued the premium of £10 for the largest quantity, not less than one hundred pairs, of thread or worsted stockings made. In 1777 it was stated that there were one hundred stocking weavers with their looms at Lancaster, Pennsylvania, then the largest inland town in the country, and that they were all out of work. The stockings made at the House of Employment, erected in that town in 1751 for the benefit of the poor, were afterwards quite noted for their excellence. There were only three stocking weavers there in 1786. In 1777 James Wallace, a foreign stocking weaver, petitioned the general court of Connecticut for a loan of £100 to aid him in erecting stocking-loom, and a machine to spin the yarn, professing to have a thorough knowledge of the hosiery manufacture in all its branches of cotton, silk, worsted, and thread. The grant was refused. In the following year Benjamin Hanks, of Windham, also asked of the assembly a premium for making stockings on looms. In 1789 two citizens of Norwich, Thomas Hubbard and Christopher Leffingwell, had eight stocking-loom in operation, and asked exemption from poll-taxes for themselves and their apprentices, which was refused by the lower house of legislature. The Rev. Dr. Stiles, of Yale, was soon after shown a pair of white silk stockings, weighing four ounces, woven on a loom made in Norwich. About the same time John Fullem, an Irish stocking weaver, set up a stocking-frame at East Greenwich, Rhode Island, which was afterwards purchased by Moses Brown, of Providence. In the last named place and vicinity 4,093 pairs of stockings, 859 pairs of gloves, and 260 yards of fringe, all household products, were made in 1790. Martha's Vineyard, at the same date, exported annually 9,000 pairs of stockings. In March, 1794, Michael Trappal, of Newark, New Jersey, petitioned Congress for an additional duty on hosiery, or other encouragement of the stocking manufacture in the United States. A duty of five per cent. was all it was deemed proper to impose at that date.

\* Bradford's American Weekly Mercury for 1723.

The census of 1810 returned as the aggregate manufacture of ten States and Territories 481,399 pairs of stockings, valued at \$572,742. Nearly one-half the quantity, or 227,578 pairs, probably nearly all hand-knit, and worth as many dollars, were returned by Virginia, and 107,508 pairs, worth \$134,406, by Pennsylvania. Connecticut ranked next in the value of its product, which was \$111,027, but it made no return of the quantity. Pennsylvania and Maryland were the only States which made returns of stocking-loom and establishments, of which the former had 136, and the latter 12.

The census of 1820 furnished little information in relation to this industry beyond the fact that stockings for the United States service employed 14 looms in Philadelphia, producing to the value of only \$4,950, and that stockings, pantaloons, and drawers were made in New York and vicinity upon four looms to a small amount.

The only stocking factory of any extent in the United States in 1831 was that of the Newburyport Hose Manufacturing Company, in Massachusetts. It employed a number of looms, operated by females, on each of which about twenty stockings of superior quality were made per diem, of cotton, wool, lamb's wool, worsted, and occasionally of silk. Domestic cotton and worsted hose and drawers from that factory, shown at the annual fair of the Franklin Institute in Philadelphia, in October, 1830, were the first of the kind ever exhibited there. The company also manufactured bagging extensively for the southern market.

About the same time an American artisan succeeded in converting the old stocking-frame of Lee into a power-loom, a result which had long been sought in England and on the continent, but appeared to have been abandoned as impracticable. As early as 1813, and the three following years, several patents were recorded by citizens of Massachusetts and New York for stocking-loom and knitting machines. But invention appeared to have slumbered until 1831, when Timothy Bailey, of Albany, New York, at the suggestion of Egbert Egberts, and assisted by him and several other persons, applied himself to the problem, and in October, 1832, put in operation at Cohoes, near that city, the first power-loom for weaving stockings or stockinet ever invented. This machine, with which Bailey and Egberts commenced the manufacture at Cohoes, where it has since become extensive by the aid of improved machines, was simply the square stocking-frame of Lee adapted to power, and produced a stocking web 28 inches wide at the rate of one inch per minute, which was cut off at proper lengths and shaped or seamed to form the stocking. By the hand-loom it was a day's work to knit two pairs of drawers, while by the power-loom a girl could weave twenty pairs in the same time, thus reducing the cost to nearly one-tenth its former rate. In 1843, when the value of stockings, wove shirts, and drawers, &c., made in the United States was estimated to be \$500,000, and the total consumption about \$2,500,000, the power-loom, which had not yet been introduced into England, was still far from being a completely automatic machine. The process of casting off and adding on stitches, in order to widen or narrow the fabric, was still performed by hand, as in the hand-frame, leaving scope for further improvements.

In the mean time our manufacturers had become possessed of the valuable circular knitting machine, which is supposed to be of French origin, and which forms the stocking leg without a seam. The first of these is believed to have been introduced into Connecticut by a German about the year 1835. Many improvements have been made both in the broad and circular stocking-loom, particularly the latter, as well by our own countrymen as by Jouve and by Jacquin, of Belgium, and more recently by Claussen, of France, who received a medal at the London Exhibition in 1851 for his seamless hosiery-loom operated by power. Most of the machines have been designed for factory use. In 1839 a rotary power stocking-loom was patented by Richard Walker, of Portsmouth, New Hampshire, at which place, during the same year, the largest stocking factory in New England was put in operation. It employed 220 hands, and made 3,000 pairs of woollen hose per week. Ten years later the Portsmouth Steam Hosiery Factory worked 60 stocking-frames by hand and seven by steam power. A small steam factory for knitting shirts and drawers was in operation also at Dover. In 1855 Mr. Jonas B Aikin, of Franklin, in that State, patented an improvement in knitting machines, which, with subsequent improvements, including a new needle known as the *latch* needle, has come into extensive use. Unlike the

greater number of previous machines, it is well adapted to family use either by foot or hand power, and can also be readily converted into a power-loom for factory use. It is claimed that the hand or crank machine for the family will knit 4,200 loops per minute, the treadle or foot machine 5,000 loops, and either of them converted into power-looms will make from 10,000 to 60,000 stitches per minute. A boy can readily attend three or four machines in the factory. By bringing into play a set of vertical needles ribbed work can be made on the same machine. A machine for making both plain and ribbed hosiery was also patented in 1860 by Mr. Tiffany, of Thompsonville, Connecticut. A rotary round knitting machine was patented in 1859 by A. Jared D. Goffe, of Seneca Falls, New York, which is used in one or more of the extensive factories at that place and elsewhere in the United States. Improvements in making seamless hosiery were patented in 1856 by William Godard, of New York city, and by W. H. McNary, of Brooklyn, the latter being for a stocking made throughout without seam, followed in 1860 and 1861 by patents for the machine itself and improvements thereon. An improved circular machine for knitting stockings without seam was also brought forward in 1862 by J. G. Wilson, of New York. An important improvement has also been recently made by Mr. Leslie, of Brooklyn, New York, on whose machine the fabric is narrowed at pleasure, which could never before be done on rotary round machines. In addition to these and other improvements in making tubular goods of different sizes and shapes, improvements have been made in the burs or wheels of circular machines which are valuable. A knitted cassimere is now produced on the knitting-frame, the web, as it leaves the machine, undergoing the same process as woven goods, whereby it takes on the appearance of woven cassimere, while it retains the elasticity peculiar to knitted fabrics. The whole number of knitting machines patented in the United States up to December 31, 1863, was 126, of which 5 were granted from 1813 to 1837; 13 from 1839 to 1851; and 108 from 1851 to 1863, inclusive. The highest number granted in any one year was eleven, and during the first three years of the present war the numbers were in 1861 and 1863 ten each, and in 1862, nine.

Many large establishments throughout the country, as the American Hosiery Company at Waterbury, Connecticut; the Waterbury Knitting Company, the Newark Patent Hosiery Company, and others, are the proprietors of patent rights to machines for various use, employed exclusively in their several factories or by their licenses. Many of these are American inventions, several of them patented about ten years ago. Others use the circular machine of Jouve, or the French loom invented by Gillet, of Troyes, as in the Enfield Manufacturing Company at Thompsonville, Connecticut, chartered in 1845, which holds the American patent to the first-named machine, and employs a considerable number of both in the manufacture of cotton drawers, cotton, cotton and wool, and all-wool undershirts, &c.

Recent improvements in the mechanism have given a vast impulse to the stocking manufacture by greatly reducing the cost and proportionately extending the demand, introducing the articles where they were before unknown. Twenty-five years ago a workman in England, with one of the old hand-power frames, could make in a week only about one dozen cotton hose, weighing two pounds. The same labor now applied to a set of the best rotary round power-frames easily produces in the same time, from 300 pounds of cotton, two hundred dozen hose, which have heretofore sold for 2s. 6d. sterling per dozen.

The principal seats of the hosiery manufacture in the United States are at New Britain and Waterbury, Connecticut; at Cohoes and Watervliet, near Albany; at Seneca Falls and at Brooklyn, New York; at Newark, New Jersey; and at Philadelphia and its vicinity, in Pennsylvania.

Hosiery and knit goods are also made to a greater or less amount at Bennington, Vermont; at Portsmouth, Franklin, Laconia, Dover, Hanover, Enfield, and Holderness, New Hampshire; at Canton, Fitchburg, Stoughton, and Worcester, Massachusetts; at Providence, Rhode Island; at Bristol, West Meriden, Derby, Farmington, Franklin, South Manchester, and Norwich, Connecticut; at Troy and Lockport, New York; at Paterson and Trenton, New Jersey; and at Cincinnati, Ohio.

Philadelphia is the largest producer in this branch; and, including the districts of Kensington, Germantown, and Manayunk, in 1860, had 71 establishments engaged on woollen knit goods and hosiery, which was made to the value of \$1,738,395; and 31 establishments making cotton hosiery, worth

\$104,450. Within about the same limits were nine or ten steam-power factories, one of the largest of which employed nearly 500 hands, about fifteen different kinds of looms, adapted to different kinds of goods, including a new loom, invented by the proprietor, for knitting neck-comforters. This factory produced about 800 different styles of goods of all sizes. A peculiarity of the business in Philadelphia and Germantown is the number of hand-loom used by the German and English frame-work knitters, long established there, who still carry it on as a household industry. Within the city proper in 1858 were about 700 hand-frames, of which 500 were employed on woollen hosiery, making to the value of about \$1,657 each, and 200 on cotton goods, the average product of which was \$897 each. Outside the city proper in 1862 were about 25 small factories, containing 5 to 25 hand-loom each, on fancy woollen work and hosiery. The product of these looms is of superior quality, and has largely excluded foreign goods from the American market.

At Albany, New York, including Cohoes and Watervliet, the product of hosiery in 1860 was \$1,099,905; and Hartford, Connecticut, inclusive of New Britain, produced the value of \$907,850.

Many of these establishments have been greatly extended since the present war began, and others have been called into existence in order to meet the large demands of the army for woollen half hose, jackets, &c. The hosiery mills at Laconia, New Hampshire, have filled large orders for government, and have given employment to many persons in making up the stocking-web after it is woven.

A silk factory in Ohio, in 1843, made annually between 600 and 700 pairs of silk gloves and stockings, averaging a little over \$1 per pair, and between 50 and 60 pairs of shirts and drawers, worth upwards of \$4 50 per pair.

The duty on foreign stockings of wool or cotton was laid, in 1816, at 20 per cent. ad valorem. In 1828 it was raised to 35 per cent. on woollen hosiery, mitts, and gloves, &c., but in 1832 was reduced to 25 per cent. In 1842 the customs tariff on cotton and woollen hosiery was fixed at 30 per cent., but in 1846 was again reduced to 20 per cent. on cotton. In 1857 the duty on both was laid at 24 per cent., but in 1862 it was raised on both kinds to 35 per cent. ad valorem.

*Statistics of Hosiery produced in the United States during the year ending June 1, 1860.*

\* In these States yarn spun elsewhere is used. This is the case in Pennsylvania and some other States.

† 280 sets machinery used.

‡ Also, 112,000 yards of stockinet produced in Connecticut.

**WOOL CARDING AND CLOTH FULLING.**

The manufactures of wool consist of two principal branches—the woollen manufacture proper, and the worsted manufacture. These are based upon the qualities and character of the wool employed, and more particularly upon its length of fibre or staple. The worsted manufacture requires a wool of long staple and firm fibre, little disposed to shrink, curl, or felt in the process of weaving or finishing. The process by which the wool is prepared for spinning is called *combing*, which is either manual or mechanical, and its object is to disentangle the fibres and tufts and dispose them as nearly as possible in parallel form.

The ordinary cloth manufacture, on the other hand, employs a short, fine wool, the filaments of which are capable of being fullered or felted together without loss of elasticity in the fabric. This wool, previous to being spun, undergoes the operation of *carding*, like cotton, whereby the fibres are disentangled and arranged in a light, orderly lap or roll, ready to be drawn out into regular threads. The beauty of the woven fabric depends upon the fineness and smoothness of the yarn, and this upon the regularity and perfection of the carding, which again is mainly influenced by the quality of the cards and of the wool.

The first thing, therefore, is to separate the wool into long and short. The latter is afterward “sorted” with the greatest care into several kinds or qualities known to the trade by specific names, and with minute reference not only to its character as pulled or shorn, but to its degrees of fineness, softness, strength, color, &c. Upon the elaborate precision and skill with which this sorting is done depends in no small degree the superior quality of the fine West-of-England cloths. Having been well scoured or washed in a mixture of wine and water or other liquor to free it from the natural grease or yolk of the fleece, and subsequently oiled, it is ready for the carding.

In regular woollen factories, many of which in the United States are very large and complete establishments, conducted with the same system that prevails in those of cotton, all the operations of assorting, scouring, carding, spinning, weaving, dyeing, and fulling are conducted on the premises. But in early times, and in some States and most rural parts at this day, where much of the domestic wool is spun and woven in families, sometimes all, and at others a part, of these processes were carried on in the household, the wool being carded by hand cards, spun, woven, and dyed in the family, and worn without fulling or dressing. In other cases the wool, after being sorted, picked, and oiled, was sent to the carding mill and returned in rolls to be spun and woven, after which it was again sent to the mill to be fullered, dyed, if not dyed in the wool, and finished. Hand cards have long been nearly obsolete, having been superseded by the automatic carding engine, which performs the work with greater perfection and economy. By passing the wool over and between a series of revolving cylinders and drums covered with card cloth of different degrees of coarseness, according to the size of the wire used in making the bent teeth with which it is studded, and to the number of the latter, the material is delivered in light, downy, cylindrical rolls ready for the spinner. Wool-carding is usually carried on by water-power, in connection with the fulling, dyeing, and dressing of cloth, which require a supply of soft water. Wool is carded at a stated price per pound. The fulling of cloth is commenced by scouring the fabric in water, holding in suspension an aluminous clay called *fuller's earth*, or other detergent, to absorb the grease. It is then washed and beaten by heavy wooden mallets in a trough, soap and hot water being copiously used in the operation, whereby the cloth acquires body and thickness by a shrinking or condensing of the web nearly one-third in its length and one-half in its width. This milling or felting which cloth undergoes in the fulling stocks renders the web close and compact, and increases its beauty and firmness, and is due to the peculiar imbricated or serrated structure of the filaments of wool, which become thereby closely and inextricably united, as is more perfectly seen in hat bodies and the felted cloths now made without spinning or weaving. After fulling, cloth undergoes a process of teasing for the purpose of raising the nap. This is done by scratching the web alternately in its linear and transverse dimensions by means of teasles, which are the seed balls of a species of thistle, called from that use *Dipsacus fullonum*, and are cultivated for that purpose in Europe,

and to some extent in the United States. The teasles are either applied by hand or arranged on a revolving cylinder in a machine called the gig mill. The next operation is that of shearing the raised nap, which, like teasing, is either done by hand or by a machine having knives of peculiar shape revolving in contact with other knives. In the manufacture of fine cloth the two operations of teasing and shearing are repeated alternately until a close, thick, short nap is obtained. The cloth is then dyed, if necessary, and stretched upon tenters, and, after being brushed and dried, is folded and submitted to a screw or hydraulic press between glazed paper boards and metallic plates heated by steam. It is then packed and sent to market.

Fifty years ago gig mills were used to a very limited extent in this country, although upwards of thirty patents had been taken out here for shearing machines, and eight or nine for the napping of cloth. One or more powerful presses had also been patented before Mr. Gilmour, in 1814, introduced here the hydrostatic press of Bramah.

The improvements of the last fifty years in domestic and foreign manufactures, and in the facilities for travel and transportation, have so increased the supply and cheapened the cost of cloth, and at the same time brought the agriculturist in such immediate contact with the manufacturer, that he can now readily exchange his wool for the varied products of the loom of home or foreign make. Cotton has also been so extensively substituted for wool as to render wool-carding and fulling mills relatively less numerous and important than they were a century since. From our older manufacturing States they have nearly disappeared. They chiefly abound in those States and localities where manufacturing establishments are few, and family manufactures predominate. Hence we find that the western and southern States, in which there are comparatively few regular factories, and where the possession of raw material invites to a larger production of household fabrics, return the greatest number. The small amount that is still done in the fulling and finishing of homespun cloths is embraced in the values with that of wool-carding, which is still required to prepare wool for spinning hosiery, yarns, and other undressed household products.

The first fulling mill of which we have any account in America was built at Rowley, Massachusetts, which was settled in 1638 by a company of non-conformists from Yorkshire, England. It was built about the year 1643, by John Pearson, at the head of tide-water on Mill river, and was still running in 1809, when one of the cedar tenter-posts, brought from England by our first cloth makers, remained perfectly sound. A second mill was built at Watertown in 1662, by Thomas Leveran, a cloth worker from Dedham in Essex. Another fulling mill was erected in that town previous to 1686. In 1681 Messrs. Draper & Fairbanks built a fulling mill at Dedham, Massachusetts, on the first artificial canal built in this country. At New London, Connecticut, the first fulling mill was built in 1693, by Peter Heckley, and land was the same year set apart for one at Waterbury. Two others were set up in New London within a few years. There was one at Newport, Rhode Island, before 1745. In 1703 twenty acres of land were granted for the erection of a fulling mill in east New Jersey, which State in 1784 contained forty-one. Others were built near the same time on the Darby and Wissahickon creeks, near Philadelphia, by the Quaker emigrants from Yorkshire and other cloth districts, among whom, in 1698, were enumerated dyers and fullers, comb and card makers, spinners, weavers, &c. Wool combers and carders received twelve cents per pound for their work. Within the present corporate limits of that city there were twelve fulling mills in 1760, and they were numerous in other towns. Although first settled, we have no account of any fulling mills being erected in Virginia until about 1692.

A very complete wool dyeing and fulling mill was put up at Jamaica, Long Island, in 1764, by Tunis Popham, and six years later the first one was built in Pittsfield, Massachusetts, which was the first place that engaged in the manufacture of fine cloth, for which it has become so noted. This, which was a type of the old-fashioned clothiers' establishments, was a double-action crank mill, driven by an open-bucket three-foot water wheel, and could seldom run in dry weather. It was furnished with hand shears, and the proprietor received forty to fifty cents a yard for fulling and finishing homespun cloth. An improved mill was erected in the town in 1776. In 1801 Authur Schofield, an Englishman,

put in operation in that place probably the first wool-carding machine in the country. It was built, without models or drawings, from memory alone, as Slater, his co-emigrant, built his cotton machinery; although the former was compelled to revisit England during its construction, to revive his recollection of the parts, so jealously did that country guard the exportation of machinery and drawings. He carded wool for 12½ cents per pound, including the picking and greasing. With his nephew, Mr. Schofield now commenced the manufacture of wool-carding machines, for sale at Pittsfield. His first machines sold for about \$1,300 each, but in 1806 he advertised double carding machines for \$400 with the cards, and \$253 without, and picking machines at \$80. Many others in that and neighboring towns obtained the machines and set up carding, the price of which was soon reduced to eight cents per pound for white and ten cents for mixed.

As wool-carding up to this time had been done altogether by hand-cards, or had been combed and spun for worsted hosiery and cloth, for which much of it was used in that day, the manufacture of cards and combs and the erection of fulling mills became objects of encouragement for several years preceding the Revolution, and large bounties were offered in several of the provinces. Hand cards were made in Boston and one or two other places before the war. About 1779 Oliver Evans, of Delaware, who was engaged in making card teeth by hand, devised a machine to cut 3,000 teeth per minute. He soon after invented other mechanism which would prick the leathers, and cut, bend, and set the teeth at one operation. A Mr. Chittenden, of New Haven, Connecticut, also about 1788 contrived a machine to make 36,000 card teeth in an hour. With these or other automatic machinery of great ingenuity, a manufactory of cotton and wool cards was established in Boston in 1788, by Giles Richard, Amos Whittemore, and others, who the next year employed 900 persons, and made yearly 63,000 hand cards. The mechanism was patented by Mr. Whittemore, the reputed inventor, in 1797, previous to which three large and as many smaller factories had been set up in Boston, employing 2,000 children and 60 men, making annually 12,000 dozens of cards, which were sent to other States, particularly the southern, and were even smuggled to England. There were two card factories in Worcester county, and some in other parts of the State, and one also in Providence, Rhode Island, from which cotton cards were sent to England before 1789, and sold at a profit. This card-making machinery effected a revolution in the manufacture, being equally adapted to sheet cards for cotton and wool, hatters and clothiers, cards and jacks. The manufacture of card clothing by machinery was first begun by Pliny Earle, of Worcester, who took out a patent in 1803 for pricking the cards. It was introduced into England, and patented in 1811, by Joseph C. Dyer, an American. Carding machines now became appendages of fulling and dyeing establishments. Towards the close of the last and during the first quarter of this century such small mills were numerous for carding the wool and dressing the cloth of farmers and of the small woollen factories which sprung up about that time.

Robert Pierpont, of Hartford, Connecticut, in the seven months following September, 1789, finished at one press 8,134 yards of cloth, of which 5,282 yards were fulled. A small factory at Stockbridge, Massachusetts, about the same time, produced five or six thousand yards of fulled cloth. Middlesex county, in that State, had 20 fulling mills in 1796, and Worcester county between 30 and 40 in 1793, chiefly employed on homespun. Deep blue and scarlet were the favorite dyes at that day. Fulling mills were numerous in Pennsylvania, where the fulling of hosiery was practiced on the Germantown stockings. There were ten in the vicinity of Reading. A fulling and dressing mill was at work on Fishing creek, near the Catawba, in South Carolina. In Pendleton district there had been one previously erected.

In 1810, according to the third census, there were in the United States 1,776 carding machines, which carded 7,417,261 pounds of wool, cotton, &c., valued at \$1,837,508. The number of fulling mills was set down at 1,682, and the quantity of cloth fulled 5,452,960 yards, valued at \$4,117,308, the whole quantity of woollen goods made in families being 9,528,266 yards.

In 1840 the number of fulling mills returned was 2,585, which probably included all regular factories, amounting to 1,420 in the woollen manufacture. In 1850 the wool-carding establishments, outside of regular woollen factories, were 680; their capital, \$739,925; cost of material, \$1,251,550; hands employed, 1,092; annual wages paid, \$225,972; and total product, \$1,739,476.

The aggregate number of fulling and carding establishments in 1860 was 712. Their capital amounted, collectively, to \$1,080,985, an average of \$1,517 each; the quantity of wool carded, 5,230,651 pounds, valued at \$1,759,125. The number of persons employed was 1,276, whose annual wages cost \$286,267. The quantity of rolls made was 5,091,196 pounds, the value of which, including the fulling and finishing done, was \$2,403,512. The average weight of rolls made in each establishment was 7,150 pounds; and the average product, \$3,375. These mills were distributed as follows, viz: in New England, 64; the middle States, 99; the southern States, 217; the western States, 328; and in the Pacific States, 4.

The New England establishments employed a capital of \$85,500, or an average of \$1,336 each, the product of their business being \$179,999, or \$2,812 each. They employed 85 males and 67 females, whose annual wages cost \$23,484, and carded 343,291 pounds of wool, valued at \$137,151. The weight of rolls made was 318,659, an average of 4,979 to the mill. Maine had the largest number of mills, numbering 37, and New Hampshire 17; Vermont and Massachusetts 5 each.

In the middle States, exclusive of New Jersey, which returned none, the capital invested in carding and fulling was \$155,655; the weight of wool carded, 482,345 pounds, and its value \$207,004. The cost of wages for 159 males and 8 females employed was \$38,664. The quantity of rolls made was 471,525 pounds, and the total value of carding and fulling was \$286,143. The average capital of each mill was \$1,572; product in rolls, 4,763 pounds; and the annual value, \$2,890. Of the whole number, 55 mills were returned in New York, and 39 in Pennsylvania. The product of the former State was 280,000 pounds of rolls, and of the latter 176,225 pounds; and the value in New York \$188,900, and in Pennsylvania \$87,543.

The southern States employed in this business a capital of \$266,900, and 317 persons, whose annual wages was \$55,624. The material used was 1,403,155 pounds of wool, worth \$459,751, which produced 1,366,635 pounds of rolls, the total value of the business being \$617,428. This was an average to each mill of 1,236 in capital, and \$2,845 in product, the weight of rolls made being 6,298 pounds each. The largest number of mills was in Tennessee, which had 69, with a total capital of \$82,300, and 100 hands. They carded 460,665 pounds of wool, worth \$160,033, and made 460,000 pounds of rolls, valued—with the fulling and finishing done—at \$219,772, or upward of one-third of the total business in those States, and only exceeded by three States in the Union. Virginia had 63 mills, being 6 less than Tennessee, which considerably exceeded those of Virginia in the amount of capital and value of product.

The capital invested in carding and fulling establishments in the western States was \$564,160, an average of \$1,720 to each mill. The quantity of wool used was 2,963,060 pounds, valued at \$939,739, and produced 2,899,586 pounds of rolls. The total product of the business, which employed 631 persons was \$1,298,319, an average of \$3,958, and of 8,867 pounds of rolls made by each mill. The States of Missouri and Kentucky returned the largest number of establishments of any in the Union, the former having 86 and the latter 81. Ohio, with 48 mills, was second in the amount of capital invested. Kentucky, with a capital of \$104,095, and 164 hands, made 761,950 pounds of rolls, and returned a product of \$319,535. Missouri had invested \$142,335, and produced 719,200 pounds of rolls, the business being set down at \$315,619; and Ohio, with a capital of \$124,510, made 406,350 weight of rolls, valued, with fulling, at \$225,856.

Of four mills in the Pacific States, Utah returned three and Oregon one. The three in Utah had a capital of \$5,400, and that in Oregon of \$1,500. The former carded 23,800 pounds of wool, worth \$14,280, and the latter 15,000 pounds, worth \$1,200. The product of Utah, in rolls, was 20,791 pounds, and of Oregon 14,000 pounds, the business in the former being set down at \$19,623, and in the latter at \$2,000.

The average value of the wool carded, calculated on the aggregate of the whole Union, was 32½ cents a pound. Its average value in New England was 39.6 cents; in the middle States, 43.1 cents; in the southern States, 33 cents; in the western States, 31.4 cents; and in the Pacific States, 39.8 cents per pound.

The loss in the process of converting wool into rolls appears to have been, on the aggregate amount carded, 2.6 per cent. In New England it amounted to 7.1 per cent.; in the middle section to 2.2; in the south to 2.4; in the west to 2.1; and in the Pacific States to 10.5 per cent. of the quantity used.

*Statistics of Wool Carding in the United States during the year ending June 1, 1860.*

## CARPETINGS.

The returns on this interest embrace the operations of 213 establishments in five New England four middle, and two western States. These, in the aggregate, employed a capital of \$4,721,768, and 3,910 male and 2,771 female hands, the annual cost of whose wages was \$1,545,692; they consumed 8,843,691 pounds of wool, in addition to considerable quantities of cotton and flax, the total value of which was \$4,417,148. The quantity of carpeting made was 13,285,921 yards, valued at \$7,857,636, an average value of fifty-nine cents per yard, which was exclusive of the quantity and value of carpetings made in families.

In 1850 the whole number of carpet factories in nine States was 116, with an aggregate capital of \$3,852,981, employing 3,881 male and 2,305 female operatives, whose labor cost \$1,246,560. The cost of raw material was \$3,075,592, and the value of the product \$5,402,634, showing an increase in ten years of 97 establishments of 43.6 per cent. in the value of material consumed, and of 45.4 per cent. in the annual product. The total increase of hands was only 495, or 8 per cent., and of male hands only 29. The average number employed by each establishment in 1850 was 53, and in 1860 only 31; but the average annual earnings of each hand in the latter year was \$231 against \$201 in the former, or nearly 15 per cent. increase.

Of the whole number of concerns, nineteen were in New England, (eleven of them in Massachusetts,) and were among the largest in the country, having an aggregate capital of \$2,716,900, and 2,169 hands, whose labor cost annually \$542,024. They consumed 6,882,477 pounds of wool and 395,000 pounds of cotton, valued at \$2,214,636, and produced 4,807,487 yards of carpetings, worth \$3,352,938, an increase of 14.8 per cent. upon the production of 1850, when it was \$2,919,783.

The middle section of the Union contained 182 establishments, (of which 137 were in Pennsylvania,) representing a capital of \$1,998,918, and giving employment to 4,482 persons, whose wages amounted to \$996,214. They consumed 2,859,714 pounds of wool, and in Pennsylvania 800,000 pounds of flax, at a total cost of \$2,194,242. Their aggregate production of carpetings was 8,424,254 yards, valued at \$4,479,419, which was an increase of 80.9 per cent. over their manufacture in 1850, when it reached the sum of \$2,919,783.

The two western States—Ohio and Illinois—returned eleven establishments, with a total capital of \$5,750, and 28 hands, whose annual wages cost \$7,284. The consumption of wool in Illinois amounted to 3,500 pounds, and its value in both States to \$8,396. The quantity of carpeting made in both was 51,580 yards, worth \$24,291, of which \$18,516 was the product of Ohio, being an increase of 208 per cent. over the product of that State in 1850, which amounted to \$6,000.

The several States individually augmented their production in the following ratios, viz: Maine, 47.3 per cent.; New Hampshire, 14.1; Massachusetts, 44.8; New York, 32.9; Pennsylvania, 138; and Ohio, 208 per cent. Rhode Island, Maryland, and Illinois, made no returns in 1850; and Delaware, which reported one small factory in that year, made no return in 1860. In Connecticut the product of carpeting declined from the value of \$1,079,292 in 1850, to \$893,100, or, in the ratio of 17.2 per cent.; and in New Jersey it fell off from \$115,099, to \$112,590, or more than two per cent.

The average value per yard of the carpeting made was, in New England, 69½ cents; in the middle States, 53 cents; and in the western States, 47 cents. In the several States the average price per yard, in cents, was respectively as follows, viz: Maine, 63; New Hampshire, 91; Massachusetts, 72; Rhode Island, 83; Connecticut, 62; New York, 71; Pennsylvania, 45½; New Jersey, 80; Maryland, 48; Ohio, 42; Illinois, 72 cents.

The carpet manufacturers of Connecticut—three in number—were, relatively, the largest in the Union, having an average capital of \$233,166, and 233 operatives, with an average product of 480,000 yards, worth \$297,600 each. They consumed an aggregate of 1,950,000 pounds of wool and 260,000 pounds of cotton, valued together at \$614,510.

Massachusetts was the only other State that reported a consumption of cotton in this business.

which amounted to 135,000 pounds, in addition to 4,774,275 pounds of wool. The average amount of capital employed by its eleven factories was \$180,118, the number of hands 123, and the product was 294,141 yards per factory, valued at \$214,338.

In the State of New York there were 28 establishments, having an aggregate capital of \$1,017,868, and 1,903 hands, or an average of \$37,691 in capital, and 70 hands. They consumed, altogether, 1,082,494 pounds of wool, and 800,000 pounds of flax, and manufactured 2,293,544 yards of carpet, worth \$1,627,960, an average of 81,912 yards.

Pennsylvania had much the largest number of establishments, (137,) most of which were in Philadelphia and vicinity, and were small hand-loom factories. The aggregate capital employed in this business in the State was \$872,200; the hands employed, 2,396—an average of \$6,366 in capital, and 17 hands to each factory. The consumption of wool was 574,720 pounds, which, in addition to yarn used, were of the value of \$1,247,059. The quantity of carpeting made was 5,931,460 yards, worth \$2,710,092, an average of 43,295 yards, and nearly \$20,000 in value to each establishment. Of the foregoing, 120 establishments, representing a capital of \$864,875, and 2,370 operatives, were in the city, and their consumption of material was 548,520 pounds of wool, worth \$1,233,277. They produced 5,884,680 yards of carpetings, the value of which was \$2,685,712, an average of more than 49,000 yards, and value of \$22,380, to each factory. The number of looms in Pennsylvania was ascertained to be 1,745, of which 1,721 were in Philadelphia, and the average product per loom of the former was nearly 3,400 yards, and of the latter, 3,418 yards.

#### HISTORY AND STATISTICS.

In no part of the world is the use of carpets so general as in Great Britain and the United States, although little more than a century has elapsed since they began to be used, to any extent, in either. In both countries their manufacture has made rapid progress within a few years. The humid climate of the former, and the comparative coldness of both countries, rendered some coverings for the floor almost indispensable to comfort, which the people of both nations are studious to promote. Hence, at a period not very remote, the clay floors of the houses, even of the nobility and of princes in England, were strewn with straw, hay, or rushes, which were often plaited into matting.

But carpets undoubtedly originated in the warmer latitudes of Asia, where the climate favored the custom of sitting or reclining much in the open air beneath the shade of trees, or in tents. As a protection from the sand and dust, mats, or coverings, at first, probably, of skins and of leather, and afterward of textile fabrics of wool, cotton, or silk, variously wrought and ornamented, were spread upon the ground, and sometimes served the added purposes of a couch by night and of a mantle by day. These articles often, at the present day, constitute the principal household effects of Oriental families—their use being nearly universal for kneeling upon during worship, and for occasions of state. The ancient Medes and Persians, the Babylonians and the Egyptians, all excelled in the manufacture of carpets. Persia, which was, perhaps, the parent of the art, is still almost unrivalled in it, and employs whole families and tribes in weaving carpets, which, though generally too small for European use, were once largely imported as articles of luxury, being remarkable for beauty of pattern and harmonious combination of rich, warm colors. The carpets of Turkey and India are similar fabrics, and, like the former, are all hand-woven. Western Europe, for a long period, was supplied with all its carpets from Persia; and the east, through the commercial enterprise of Venice and Spain, obtained them through the Moors.

About the year 1607, and according to some accounts much earlier, the manufacture of wool carpets was first introduced into France at Aubusson, from Persia, under the patronage of Henry IV and his minister, the Duke de Sully. In 1664 another manufactory was established at Beauvais by Minister Colbert, who soon afterward united the first one with the celebrated tapestry factory established by Jean Gobelins, of Flanders. Another large factory for making carpets in the style of the modern Wilton was established at Chaillot, near Paris. The first named of these establishments is now the

property of the French government, and sent to the World's Fair, in 1851, superb specimens of Gobelin carpets and tapestry.

In England carpets were so little known in the middle of the twelfth century that it is cited as an instance of the luxurious living of Thomas à Becket that his sumptuous apartments were daily spread with clean straw or hay. In the reign of Henry VIII an unsuccessful attempt was made by William Shelden, esq., to establish a manufactory of tapestry and carpets; but in the time of Mary, and her successor Elizabeth, the royal presence chamber presented the incongruous spectacle of walls hung with splendidly embroidered tapestry, while the floors were strewn with rushes or hay. Floors of polished and waxed oak were often seen in early times, however. In 1609 a more successful attempt was made by Sir Francis Crane, who, aided by a grant from King James I, established the weaving of carpets and tapestries at Mortlake, in Surrey. The manufacture was improved and extended in England by the Protestant Huguenots, who forsook France in 1685. About the middle of the last century, when the manufacture had become somewhat extended, the manufacture of Turkey carpets was brought to England by two artisans from France, and by the efforts of Mr. Moore, the secretary of the Society of Arts in London, was so improved that the society awarded him a premium for the best imitation of Turkey carpets. Their manufacture was established at Axminster in 1755, and, though no longer made there, have since borne the name of that place. These carpets, which, being made in one piece, often of large size, and having numerous tufts of colored worsted inserted and secured by the shoot, are very tedious to weave, requiring several persons to manage the colors and designs, were rendered still more costly than the elegant original by the use of worsted instead of woollen yarn, and hence the production was never large.

Kidderminster, Wilton, Cirencester, Worcester, Axminster, Halifax, &c., in England, and Kilmar-nock, in Scotland, are the principal seats of the carpet manufacture, but the local names given to the several kinds are not always indicative of the present or original place of production. Kidderminster is the principal manufacturer of Brussels carpet, having a weft of linen, and the kind called Kidderminster or two-ply, and in America ingrain, are principally made in Scotland and Yorkshire. Wilton carpets—the French Moquette—differ from Brussels chiefly in having the worsted loops, after the withdrawal of the wires on which they are formed, cut through with a sharp knife to form a pile in the manner of plush or velvet. Royal Wilton has the pile raised higher than the common Wilton. Plain Venetian carpets, used for bed-rooms, stairs, &c., are not known ever to have been made at Venice. Halifax, England, probably contains the largest carpet manufactory in the world, that of Messrs. Crossley & Sons, who lately employed a capital of £1,650,000 sterling, and 4,400 work people.

Many improvements have been made in the carpet manufacture in Great Britain. Among these may be named that of Richard Whytock, of Edinburgh, whose combined improvement in weaving and printing has given rise to a new and elegant fabric known as patent tapestry and velvet pile carpet, resembling the Wilton in texture, but superior in richness. This is made by many of the largest carpet manufacturers, of whom one alone, in 1858, employed 300 steam power-looms on that principle. A process of double weaving, introduced by Mr. Templeton, of Glasgow, produced a carpet on the cheneille principle. The patent wool Mosaic carpet, made by cementing a close velvet pile on plain cloth by caoutchouc, introduced from Germany, has been improved by Messrs. John Crossley & Sons, of Halifax. A cheap carpet is extensively manufactured near Manchester, for exportation, under the Sevier patent, being first woven in plain colors by steam power, and afterward printed with colored blocks. Felted carpets, which are also made in Persia and called *mirmuds*, are also made and printed in colors in England to a considerable extent, as also are hempen carpets, introduced from Russia, having the colors running in stripes, but of little durability. James Melville, of Scotland, has patented an improvement in printing carpets and shawls. This manufacture in England is now estimated to employ more than 5,000 looms on goods of every description, and the value of carpeting exported thence to the United States alone, in 1859, was \$2,174,064, while the value of French make imported by us was only \$10,317.

Although carpets are now used in the United States probably to a greater extent than in any other country, not only in private houses, but in churches, public buildings, counting-houses, offices, &c., they were seldom seen here before the Revolution, and then only in the houses of the most wealthy. In New York, where Scotch and other carpets were advertised for sale by one or two persons about 1760, the house of a wealthy Dutch merchant or burgher may have occasionally contained a carpet in early times, although the first one ever seen there is said to have been found in the dwelling of the pirate Kidd, executed in 1701. It was merely a good-sized Turkey rug, doubtless the ill-gotten booty of his unlawful ventures. With the exception of a crumb-cloth of drugget sometimes found in the best parlors, a floor scrubbed white and sprinkled with fine white sand, often brushed into fantastic circles and curves, contented our female ancestors in colonial and even more recent times.

As early as 1791 a carpet manufactory, conducted by William Peter Sprague, was in operation in the Northern Liberties of the city of Philadelphia, in which were made carpetings called Turkey and Axminster. Mr. Sprague wove a national pattern, with a device representing the arms and achievements of the United States. It was probably in reference to this enterprise that Mr. Secretary Hamilton, in his report on manufactures made in that year, recommended an addition of  $2\frac{1}{2}$  per cent. to the duty (5 per cent.) then payable on imported carpets and carpeting as some encouragement to beginnings already made in the manufacture at home. At Providence, Rhode Island, and vicinity, in the same year, and probably elsewhere throughout the country, considerable quantities of carpeting were woven in families for domestic use. A manufactory of carpeting was also established at Philadelphia previous to 1807 by John Dorsey, esq.

The census of 1810 returned 9,984 yards of carpeting and coverlets made, of which quantity 7,501 yards, worth about as many dollars, were made within the present limits of Philadelphia, and 750 yards, valued at \$2,500, in Harford county, Maryland. The only establishment for stamping floor-cloths was in Philadelphia, and its product was 1,500 yards, valued at \$3,000.

This new article, called patent floor oil-cloth, now so extensively manufactured, was introduced as a summer carpeting, and probably from abroad. It was a strong, canvas fabric, woven without seam, on a seven-yard loom, of any desired size or shape, and afterward covered with a coating or varnish of oil, turpentine, &c., and sold plain, or in colors, with borders to match, at \$1 25 to \$2 per square yard, according to the number of colors. The proprietor, Mr. Isaac Macauley, who was probably one of the first manufacturers of the article in this country, established his factory at Bush Hill, Philadelphia, where he also produced other descriptions of oil-cloth in a great variety of patterns, and ingrain wool, and Brussels carpeting. In 1821 he had a contract for supplying the new State-house at Harrisburg with ingrain carpeting of his own make, and in 1825 was granted letters patent for the manufacture of oil-cloth. About the close of the war with Great Britain a manufactory of this article was also established in or near New York, which, in 1820, employed eight hands, and made upward of \$27,000 of patent painted floor-cloth. There was at the same time another factory, with six hands, in Brooklyn, and one in Baltimore, employing fifteen hands; but the product of the latter was returned at only \$6,500.

In 1828 there were five manufactories of floor oil-cloths in the United States. In common with all other branches, the manufacture of carpets, except in families, was nearly suspended by the influx of foreign goods on the return of peace.

The census of 1820 reported small amounts of wool carpeting woven at Newport, Rhode Island; in Queen's county, New York; at Washington, D. C.; and in Frederick county, Maryland; much of which was made for customers. Some stair carpeting was, about this time, made in Baltimore by a Mr. Wilson.

As early as 1806 Francis Guy, of that city, sent into the United States Patent Office specifications for a patent for making paper carpeting. Letters patent were granted him for this invention in 1819, up to which time he had continued to improve the article so as to satisfy himself and others that carpets for summer use could be made of that material as durable as canvas floor-cloth, and much more beau-

tiful, at half the cost. In 1818 a citizen of Springfield, Massachusetts, advertised 1,000 yards of *straw* carpeting, from four to six quarters wide, and in price at 28, 37, and 42 cents a yard.

During the next twelve or fifteen years small manufactories of ingrain and other carpets sprung up in different parts of the country. One of these was at Medway, Massachusetts, where carpets, considered equal to the best Kidderminster, were made. There were several others established in the vicinity of Boston; one at Wheeling, Virginia, which made Scotch and Venetian carpets of good quality, and another at Martinsburg, in that State.

About the year 1827 a manufactory of carpets and shawls was established at the village of Tariffville, in Hartford county, Connecticut, by an incorporated company, under the direction of H. R. Knight. Some of its early products were pronounced excellent fabrics. In May of the following year the Thompsonville Company, in the same county, was chartered for the manufacture of every description of carpeting, the weavers first employed being principally Scotch. In 1832 the first of these employed a capital of \$123,000, and 95 male weavers, and gave support to about 367 persons. It produced 114,000 yards of ingrain, or Kidderminster carpeting, equivalent to more than one-fifth the average annual importation of the country. In 1845 these two establishments, which then as now were chiefly owned by the same parties, were about the largest in the country, employing each about 1,000 persons. The Thompsonville factory, made about 1,600 yards daily of every kind of carpets and rugs, including Axminster, Wilton, Brussels, three-ply, super, ingrain, damask, Venetian, &c.

The Lowell Manufacturing Company, at Lowell, was incorporated in 1828, and, in addition to cotton looms, ran about 70 carpet looms, producing weekly about 2,500 yards of ingrain, Brussels, and other carpetings, and 150 rugs. Twenty-eight thousand yards are now made there weekly. In 1830 a manufactory of imitation Brussels and ingrain carpets was put in operation at Carlisle, Pennsylvania, by Mr. Samuel Given, whose goods were highly spoken of. A good article of felt carpeting was made in 1829 at Catskill, New York, for making which a patent was granted the same year to two citizens of that county. In 1833 there were three carpet factories in operation in Columbia county, in that State, and one at Rochester. There was also a large one at New Haven, Connecticut, and about 18,000 yards were annually made by the Norwich Manufacturing Company, in New London county. The Great Falls Manufacturing Company, at Somersworth, New Hampshire, also made carpeting. About the same time a carpet factory in Baltimore, owned by C. G. Conradt & Co., employed 28 carpet looms, and 40 women and children, producing annually 80,000 yards of carpeting. There were two or three carpet factories at this time at Steubenville, Ohio, and others in different parts of the Union.

In December, 1834, there were in operation in the United States at least 511 carpet looms in from 18 to 20 factories. Of these, 18 were for Brussels, 21 for treble ingrained, 424 for other ingrained, 44 for Venetian, and 4 for damask Venetian. Upon these looms were made annually of Brussels carpeting, 21,600; three-ply, 31,500; other ingrained, 954,000; Venetian, 182,000; damask Venetian, 8,400; total, 1,147,500 yards. Its average value was estimated at one dollar per yard.

The American market at this date was supplied in a great degree with carpets of all kinds of domestic manufacture. Large quantities of an inferior quality were still made in families, and in some sections, as in several counties of New Hampshire, the amount of it made and sold in other States was supposed to exceed the amount of foreign articles consumed in them.

The average quantity of carpeting imported from 1828 to 1832 was 536,296 yards, valued at the place of export at \$416,944. In 1833 the following quantities were imported, viz: Brussels, Wilton, and three-ply, 104,108 yards, valued at \$147,820; ingrain and Venetian, 240,668, value, \$171,606; all other kinds, 337, value, \$166; total, 344,113, value, \$319,592.

The increased manufacture of carpetings which had taken place within a few years resulted in part from the attention given for a still longer period to wool-growing and improvements in the breed of sheep, the number of which, in 1831, was estimated at 20,000,000. It was mainly due, however, it is probable, to the stimulus applied by Congress to the woollen manufacture by augmented duties on foreign woollens. In April, 1816, Congress laid the duty on woollens at 25 per cent. ad valorem until

July, 1819, and after that date at 20 per cent., and on painted floor cloths at 30 per cent. In 1824 the duty was raised to  $33\frac{1}{3}$  per cent. on all woollens costing over  $83\frac{1}{3}$  cents per square yard, the effect of which was countervailed in England by reducing the impost on foreign wool from 6*d.* to 1*d.*, and afterward to  $\frac{1}{2}$ *d.* sterling per pound. The American high tariff act of 1828, framed with especial reference to the woollen manufacture, imposed a duty of 70 cents per square yard on Turkey, Brussels, and Wilton carpets, of 40 cents on Venetian and ingrain, and of 32 cents on other kinds; painted floor cloths paying 50 cents the square yard. The high duty undoubtedly called into existence many carpet and woollen factories, although its benefits were in a measure counteracted by a duty of 4 cents a pound and 40 per cent. ad valorem at the same time laid on foreign wool when imported, the cheapest qualities of which were altogether imported. By the subsequent act of July, 1832, when the importation of wool amounted to upward of 4,000,000 pounds, about one-half of which was low-priced wool from the Levant, Turkey, and Egypt, wool costing less than eight cents a pound was placed on the free list, and the duty on the higher priced carpetings above named was reduced to 63 cents, and on common carpetings to 35 cents the square yard.

A rapid increase of carpet factories, and especially of floor oil-cloth establishments, followed these measures, and enabled American manufacturers to supply at from \$1 25 to \$1 75 per yard as good an article of floor cloth as could be imported at from \$2 to \$2 50 per yard, which was the price of the best English. In 1848 there were five oil-cloth factories in the town of Newburgh, in Orange county, New York, and two years later there were 19 in the State and 56 in the Union. In 1836 a factory of considerable size was erected at Poughkeepsie, in that State, for weaving ingrain carpets, which soon afterward turned out annually 100,000 yards of three-ply, superfine, fine, and common ingrain, and plain and twilled Venetian stair-carpeting, and about 1,000,000 yards of carpet binding. Another was started at the same place the next year by C. M. Pelton.

Up to this time the weaving of ingrained carpeting, both in this country and in England, had been done exclusively on hand-looms. Many improvements on the common carpet-loom had been made or attempted in both countries, some of which have been mentioned. But the jealousy with which the exportation of textile machinery had been watched made it difficult to obtain the latest improvements, except occasionally by the way of continental ports, in which way Mr. Haight, of New York, is said several years ago to have obtained carpet-looms. Several patents were granted in the United States between 1820 and 1840 for ingrain and other carpets, and for looms for weaving such fabrics, among which were two in 1830 to William Sherwood, of Somersworth, New Hampshire, one for an ingrain carpet-loom, and one for taking the figures of such fabrics, which improvements were probably used by the Great Falls Company at that place.

Power-looms as yet had been little used, except in the manufacture of the plainest and simplest fabrics, and in Europe all efforts to employ them in weaving ingrained carpets had been abandoned as impracticable. The difficulty of incorporating two distinct webs, such as compose the two-ply or Kidderminster carpet, into one fabric at a single operation, so as to bring the colors regularly to the surface and make the figures match, and at the same time leave a smooth surface and a perfect selvedge, seemed to require so many adjustments under the guidance of ever-present watchfulness and judgment as to be utterly beyond the power of automatic art on any scale that would pay. This difficult achievement was most successfully accomplished by Mr. Erastus B. Bigelow, of Massachusetts, who had previously, when quite a young man, and without any mechanical training, devised a power-loom for weaving knotted counterpanes, and another for weaving coach lace, by simply studying the texture of those fabrics. The coach lace loom, patented in 1837, contained all the essential principles of the Brussels carpet loom afterwards matured by him. Having, in connexion with his brother, Horatio N. Bigelow, and others, established the Clinton Company, at Lancaster, Massachusetts, for the manufacture of coach lace, and supplied the Lancaster Quilt Company, at the same place, with an entirely new counterpane loom, Mr. Bigelow made, it is said, a written contract to furnish a company at Lowell with power-looms for ingrain carpeting before he had even made a model or drawing of the machines. His

first power-loom was erected within a year, and averaged ten to twelve yards of carpeting per diem, the product of the hand-loom being only eight yards a day, and inferior in quality. A second loom with improvements produced eighteen yards per diem; and a third, essentially modified and improved, raised the product to twenty-five or twenty-seven yards daily of two-ply, and of seventeen or eighteen of three-ply, and superseded the first machines. The Lowell Manufacturing Company, which are the assignees of the patentee, and were the first to manufacture carpeting successfully by power-loom, erected a new mill of great size, which was supplied with 200 iron power-loom. These have continued to make annually 1,300,000 yards of two and three-ply ingrain, and 2,500 tufted and chenille rugs. They reduced the price of weaving two-ply carpets from 11½ cents to 2.51 cents per yard, and of three-ply from 25 cents to 2.83 per yard, the higher prices being the wages paid before their introduction. In 1848 Mr. Bigelow introduced the Brussels carpet loom, which was the coach-lace loom, so modified as to adapt it for weaving wider fabrics in figures to match, and afterwards to admit of a velvet pile. In the following year he organized the Bigelow Carpet Company at Clinton, Massachusetts, to run 30 power-loom, which made with perfect success five-frame Brussels, Wilton, and tapestry carpets, and, in fact, every kind of looped and velvet pile fabrics required. Attended by a single female, each loom wove with ease 20 to 25 yards daily of Brussels carpeting of the best quality, three or four yards being the average product of a hand-loom. This at once reduced the cost of weaving Brussels carpet from 30 to 4 cents per yard.

These and other improvements of Mr. Bigelow in textile machinery form a series of mechanical inventions which are covered by upwards of twenty American patents. His ingrain power-loom, which have reduced the price of carpetings probably twenty per cent, were introduced into the great factories of the Hartford Carpet Company at Tariffville and Thompsonville, Connecticut, each of which paid a royalty to the Lowell Company of about \$25,000 per annum, and are capable of producing annually 1,700,000 yards of ingrain, 500,000 yards of Venetian, and 200,000 yards of Brussels carpetings. The Bigelow power-loom have also been employed in the large establishments of A. & E. S. Higgins in New York, in one at Troy, in that State, for making tapestry and velvet pile carpets and rugs. The American patent has recently expired; but the Hartford Company, in the last 8½ years, paid in aggregate dividends upward of one million dollars.

The product of the Bigelow Company at Clinton, Massachusetts, in Brussels carpeting is about 500,000 yards yearly, exceeding the total annual importation of that article at the time the looms were introduced to the public.

In 1851 Mr. Bigelow exhibited specimens of power-woven Brussels carpeting at the World's Fair in London, which the jury declared were "better and more perfectly woven than any hand-loom goods brought to their notice;" and the proprietor was acknowledged to have been the first successfully to use the power-loom in their manufacture. He obtained a patent in England the same year, and large orders were soon after given by Messrs. Crossley & Sons, of Halifax, for power-loom for their extensive manufactory at that place, now, perhaps, the largest in the world. The proprietors who now hold the patent right of those machines for the United Kingdom had already found themselves unable to compete with the superior machine-made American carpets, but, by the aid of power-loom, were soon after able to reduce the cost of weaving from 14d. to 2½d. per yard, and give better wages to their work-people for fewer hours of labor.

Many minor improvements in carpet machinery and designs have been made by Americans within a few years, including modifications of the Jacquard loom, which has been much employed in carpet-weaving.

In 1845 Massachusetts contained 17 carpet mills, with a capital of \$488,000 and 1,034 hands, producing 1,158,958 yards of carpeting, worth \$834,322. In 1855 it contained 13 factories, whose capital was \$2,264,172. The number of hands was 1,614, and the product 1,988,460 yards, valued at \$1,362,819. New York State, in the latter year, had, according to the State census, 18 carpet mills, employing 1,988 persons. They employed a capital of \$1,199,470, of which \$934,200 was in machinery,

and the balance in real estate, and the value of their product was \$2,076,703. The principal factories were at New York, Auburn, Poughkeepsie, Amsterdam, Newtown, and West Farms. Messrs. A. & J. Smith, of the latter place, held a patent for an improved style of weaving tapestry, ingrain, or chenille carpets in medallion figures, granted, we believe, in the previous year to John G. McNair.

The number of power-looms in operation in the United States in 1857 was estimated to be upward of 5,000, which were unable to supply the demand.

In Philadelphia and its vicinity, where the largest amount of carpeting is made, several peculiarities in the trade are noticeable, relating both to the character of the goods and the system of manufacture. The large New England manufactories are almost exclusively engaged in the production of super and extra fine carpets from wool and worsted materials, and chiefly by the aid of power-looms. In Philadelphia the product embraces ingrain and Venetian carpets of every quality known in the market, from damask Venetians, costing before the war \$1 to \$1 15 per yard, down to cotton and wool, and all-cotton carpets, sold for about 20 cents the yard. These are chiefly woven on hand-looms, of which, in 1857, there were at least 1,500 distributed among 100 manufacturers, the largest having 150 looms, one manufacturer only employing a few power-looms. Each hand-loom made about 4,320 yards annually, and the total product was about 6,480,000 yards, worth, at a low average of 40 cents per yard, \$2,592,000 per annum. In addition, there were 560 looms engaged on rag and list carpets, of which 1,680,000 yards, worth, at an average of 30 cents, \$504,000, were made annually. The average price of weaving ingrains was 9 cents a yard, and of rag carpets, 6 to 10 cents. The whole number of persons employed was about 3,130, whose annual wages was \$821,000. The aggregate production of carpetings of all kinds was 8,160,000 yards, valued at \$3,096,000 per annum. An English manufacturer, a few years since, stated that more yards of ingrain carpeting were made annually in Philadelphia than in all Great Britain. Improvements have been made and patented by the proprietors of the Bridesburg Machine Works, in that city, in the carpet-loom, which, in its latest form, carries 32 shuttles, and is capable of laying 16 different colors in the figure and as many in the ground of the carpet.

The Bay State Mills, at Lawrence, Massachusetts, formerly made an excellent article of printed felt carpeting, the materials of which were felted in the manner of a hat body into a firm fabric with a white ground, which was afterward printed on blocks in a variety of brilliant colors and elegant designs, and sold either as floor-cloth or drugget at 75 cents to 90 cents the yard, according to width, which varied from 40 inches to two yards. The American Felting Company and the Mystic Mills, at Winchester, Massachusetts, also make felt carpetings.

A new article of printed carpetings, rugs, and crumb-cloths is made by the Fibrilia Manufacturing Company, at Lawrence, in which *fibrilized* or *cottonized* flax is used as a substitute for cotton and wool. Hemp carpeting has been made by a mill at Paterson, New Jersey, and probably elsewhere.

Fine carpets are manufactured by only about six large establishments at this time. Four of the largest companies have an aggregate capital of \$6,500,000, and three of these are alone capable of making annually an aggregate of 4,500,000 yards of carpetings of various kinds. One of them employs 288 power-looms, and makes upward of 2,000,000 yards annually. One of the four companies referred to makes only Wilton and Brussels carpets and rugs; another, only two and three ply ingrains; a third, ingrain, Venetian, and Brussels; and the fourth, velvet, Brussels, ingrain, and Venetian and rugs.

Although the financial state of the country during the present war has generally been favorable to large sales, the high cost of materials has proved embarrassing to home manufacturers. The imports of all kinds of carpeting during the fiscal year ending June 30, 1862, amounted to 559,928 square yards, valued at \$466,596.

The present tariff is nearly prohibitory, and we may soon expect to find the market entirely supplied with carpetings of domestic manufacture.

# INTRODUCTION.

*Statistics of carpets manufactured in the United States during the year ending June 1, 1860.*

STATES.	Number of establishments.	Capital invested.	RAW MATERIALS USED.			Cost of raw material.	NO. OF HANDS EMPLOYED.		Annual cost of labor.	ANNUAL VALUE OF PRODUCTS.		Per cent. increase.	Yards of carpeting produced.	Average value per yard.

## CLOTHING.

The manufacture of men's and boy's wearing apparel for sale, ready made, is a branch of industry which has grown up within a few years, and in all our principal cities has become one of considerable magnitude and importance. The statistics of this branch, including the custom business of the tailor and clothier, but excluding shirts, collars, and other furnishing goods for men, and all women's wear, in 1850 employed 4,278 establishments, having invested a capital of \$12,509,161. The consumption of raw materials amounted to \$25,730,250; the hands employed numbered 35,051 males and 61,500 females, whose annual wages were \$15,032,340, and the aggregate value of the product was \$48,311,709.

The returns of 1860 show a decrease of 485 in the number of establishments, but a considerable increase in the aggregate values above enumerated, and a small increase in the total number of hands employed, as follows, viz: number of clothing establishments, 3,793; capital invested, \$24,939,193; cost of material, \$39,976,845; male hands employed, 41,173; female hands, 57,730; cost of labor, \$18,942,888; value of product, \$73,219,765. The aggregate product was augmented \$24,908,056, which was at the rate of 51.5 per centum. The number of female employes was diminished 3,770, and the male hands were increased 6,122, making the total number of persons employed 2,352 more than in 1850.

In the number of establishments devoted to this business there was a decrease, amounting in the eastern, middle, and southern States together to 730, which was in part counterbalanced by an increase of 245 establishments in the western and Pacific States. In the New England States the decrease was 222, Vermont and Rhode Island alone showing increase. In the middle section there was a diminution of 484 in the total number of concerns, with only a small increase in two States. The western States showed an aggregate increase of 228, Kentucky alone having reduced the number of its

clothing establishments from 131 to 79. In all but four of the southern States there was a decrease in the number, but the general deficiency was nearly compensated by an increase of 138 establishments in Louisiana, making the total decrease in this section only 24. The whole number of clothing establishments in New England was 499; in the middle States, 1,887; in the western, 1,040; in the southern, 352; and in the Pacific States, 15. Eleven of those last named were in California, and all but one in New Mexico were the creation of the ten years preceding the census.

The falling off in the number of clothing establishments in the older States, and particularly in some of the large cities, was due in part to a silent revolution which had been going on in this business for a number of years, chiefly through the agency of the sewing machine, whereby many small shops have been merged into large wholesale establishments for the manufacture and sale of ready-made clothing, which has now become an important commercial interest. Hence, notwithstanding there were in 1860 fewer clothing establishments than in 1850 by upwards of 11 per cent., and an increase of only 2.4 per cent. in the aggregate number of hands employed, the amount of capital invested in the business had augmented nearly 100 per cent., and the aggregate value of the product 51.5 per cent., as compared with the returns of 1850.

The total value of the clothing manufactured in New England was \$11,408,333, a decrease of 8.3 per cent. in ten years. The capital invested in the business was \$2,719,430, and the hands employed were 3,095 men and 10,427 women, the annual cost of whose wages was \$2,353,740, an average of \$174 to each. The value of raw material consumed was \$6,266,463. Upward of one-half the product, or \$6,070,975, was returned by 196 establishments in Massachusetts, having a capital of \$1,498,400 and 5,647 hands, which was 30.6 per cent. below the product of that State in 1850. Of that product Boston returned about three-fourths, or \$4,567,749, as the proceeds of a capital of \$1,078,300, and 4,017 hands, which figures by no means overstate the large clothing business of that city. Connecticut, also, showed a diminished product in the ratio of six per cent., while each of the other New England States exhibited an increase, which in Rhode Island amounted to 169.4 per cent., that State having increased the number of its establishments from 22 to 55. Maine ranks second among the New England States in the extent of capital and value of its product, the latter amounting to \$1,635,354, much of which is manufactured for Boston firms, who distribute their work in large quantities throughout that State and a part of New Hampshire to be made up and returned through a peculiar system of agencies.

The clothing manufacture of the middle States employed a capital of \$16,370,702, and paid for raw material \$25,273,136, and for labor \$12,269,570 per annum, the latter being the wages of 27,318 male and 36,932 female hands, an average of \$191 per annum to each. The total value of the product was \$45,236,596, an increase of 58.4 in ten years, and equivalent to 93.6 per cent. of the product of the whole Union in 1850, and 61.7 per cent. of the same in 1860. The States of New York, New Jersey, and Pennsylvania, respectively, augmented their production in the proportion of 56.3, 62.6, and 61.2 per cent.; and the product of Delaware, though small, was 115 per cent. above that of 1850. The manufactories in New York State numbered 860, and they had invested a capital of \$8,038,361, consumed raw material to the value of \$14,540,050, and paid, as the annual wages of 14,767 males and 17,696 females, the sum of \$6,190,182. The total value of the clothing made in that State was \$25,095,299, which was nearly equal to the combined product of the New England and western States together, and more than half that of the entire Union in 1850. New York city and vicinity alone made a return of 303 establishments, employing \$5,645,800 in capital, and 21,568 hands, with an annual product of \$17,221,856, of which \$210,486 belonged to Brooklyn and Williamsburg. Pennsylvania, next to New York, made the largest amount of clothing of any State, and had 672 establishments, whose united capital was \$5,256,201, the cost of material being \$6,230,568, and the annual wages of 7,828 men and 10,090 women, \$3,012,522. The total value of clothing made in the State was \$12,305,541, which, though scarcely half that of New York, exceeded the total production of New England, and was about one and a half million less than that of all the western States. Of the manufactories, Philadelphia contained 344, using a capital of \$4,249,775, and paying for raw material \$5,071,736, which gave

employment to 6,275 male and 7,928 female hands, whose annual product was \$9,962,800, or more than three-fourths the product of the whole State. New Jersey and Maryland, respectively, ranked as fifth and sixth in the value of this industry, which, in the former, showed a product of \$4,042,002, and in the latter of \$3,271,116, either of which amounts exceed the total production of the southern States in this branch.

The western States had invested a capital of \$5,186,801, and consumed raw material worth \$7,145,942. They employed in the manufacture 9,687 men and 9,689 women, the annual cost of whose wages was \$3,727,452, an average of \$192 each, and the total product \$13,907,625, an increase of 138 per cent.

The largest producer in that section was Ohio, which numbered 448 establishments, having \$3,052,365 in capital, and giving employment to 6,356 male and 6,927 female hands, with an annual cost for raw material of \$4,388,169, and for labor of \$2,328,348. Its annual production of clothing was valued at \$8,771,068, which was 217 per cent. in excess of its manufacture in 1850, and placed the State in the third rank as regards the value of this branch. A large proportion of the product of Ohio was manufactured by 222 establishments in Cincinnati, having invested \$2,200,900, and consuming raw material valued at \$3,076,571. The annual product of these was \$6,381,190, or nearly three-fourths that of the entire State, and more than double the product of the State in 1850. It was made by 5,016 males and 4,963 female hands. The number of persons employed in this branch in Cincinnati was more than double, and throughout the State about three-fold the number so engaged in the whole State in 1850. Kentucky was the only other western State in which the value of this manufacture reached one million, and it exhibited the smallest increase of any, its product being only a little more than in 1850. The relative increase of the business in other western States was in the following ratio, viz: in Indiana, 131 per cent.; Illinois, 75; Michigan, 132; Wisconsin, 235; and Missouri, 26.3 per cent., respectively. Minnesota made no return in 1850, and only \$5,765 in 1860.

In the southern States the manufacture of clothing amounted to only \$2,573,045, the product of 352 establishments, which had capital invested to the amount of \$639,995, and paid for material \$1,239,983, and for the labor of 1,038 males and 681 females, the sum of \$562,936, the wages averaging \$327 for each hand. Louisiana showed the largest production, as well as the greatest relative increase, its product being \$1,707,072, or nearly two-thirds the production of that section, and its rate of increase 402.3 per cent. Mississippi increased its manufacture 222.8 per cent. Arkansas and Florida also showed an increase; but in all the other southern States there was a diminished production of clothing as compared with 1850.

The product of the Pacific States amounted, altogether, to \$94,186, more than one-half of which was made in eleven establishments in California.

The diminution, which, on a further comparison of these statistics with those of the preceding census, appears in the number of hands employed in some parts of the country, and the small relative increase in others, is attributable to two causes. The returns of the number of persons employed in this industry in 1850 were, in several instances, too great; because the whole number employed throughout the year, some of them only temporarily, were given, instead of the average of the hands constantly employed, as required by the instructions, and as has been done in the recent schedules. Another cause, however, is found in the substitution of machine-sewing for hand-stitching, which, as already stated, has coincided with the natural tendency of capital to reduce the number of small tailoring establishments, and to build up, in the principal business centres, extensive ready-made clothing houses, in which, as in many customer-shops, much of the work is performed by sewing machines, to the exclusion of the needlewomen. Hence, in many of these large wholesale establishments it is not uncommon to find that the principal cutters and salesmen are men who have been once known as merchant-tailors, but have concentrated their capital and influence in the larger concerns. Aided by cheap and rapid communication with all parts of the country, these are enabled thus to command a wide range of custom, and with all

the advantages of large capital and machinery, supply every town and village with ready-made clothing, at the lowest prices.

In the eastern, middle, and southern States there was a decrease in the number of female hands, amounting, in the aggregate, to 8,308, which was, in part, balanced by an increase of 5,248 female hands in the western States. The largest displacement of female labor was in New England, where machinery has been most largely substituted, and amounted to a deficiency of 5,780, or more than one-third of the number employed in 1850, and in about the same proportion with the decrease of male hands. In the middle States the females employed numbered 1,723 less than in 1850, and the males 2,848 more than in that year. In the west the male hands increased 5,098, and the females 5,249; while in the south both classes were diminished, the former 342, and the latter 775.

The effects of consolidation of capital in large establishments, and of machinery, are further apparent in the augmented capital and product of the business generally, and in the average of each establishment, and also in the better average compensation of each hand, as compared with 1850.

The total increase of capital in 1860 was in the ratio of 99.3 per cent.; the cost of raw material 55.3 per cent.; cost of wages, 26 per cent.; number of hands, only 2.4 per cent.

The average product of each clothing establishment in 1850 was \$11,293; product per hand, \$500; capital of each, \$2,924; cost of raw material each, \$6,014; cost of labor each, \$3,747; average number of hands each, 22; and average cost of wages per hand, \$155. In 1860 each establishment, on an average, produced \$19,303, increase 71 per cent.; the product per hand was \$740, or 48 per cent.; capital, \$6,575, or 125 per cent.; cost of material, \$10,691, or 77 per cent.; cost of labor, \$4,994, or 33 per cent.; number of hands, 26; and wages per hand, \$191 each, an increase of 23.2 per cent.

In 1860 the average product of each establishment in New England was \$22,863, or 33.3 per cent. greater than in 1850; in the middle States the average was \$23,972, increase 99.1 per cent.; in the south, \$7,309, increase 77.2 per cent.; in the western States, \$13,372, an increase of 85.9 per cent.; and in the Pacific States, \$6,279 each.

#### HISTORY AND STATISTICS.

The manufacture and sale of clothing constitutes a branch of trade which is everywhere directly dependent upon the progress of wealth and refinement. Next to shelter and subsistence, the principal want of mankind is for clothing adapted to the circumstances of climate, season, national habits, or individual taste and caprice. The temperate latitudes and the most refined nations, with accumulated wealth, give the largest scope and the amplest rewards to the clothier and costumer. The inhabitant of the frigid zones is forced to dress in skins and furs, while those of tropical climates either reject clothing, or content themselves with loose and flowing garments of the lightest and simplest materials and little diversified in style. The rich and highly civilized nations, on the other hand, which chiefly occupy the temperate zones, by reason of the regular succession of seasons, the gradations of society, the general diffusion of wealth, the multiplicity of arts and occupations, and the personal freedom allowed, encourage a corresponding diversity of costume to meet the varied wants and tastes of each individual, under the changing caprices of fortune or of fashion. Hence we find so large a proportion of the productive industry of civilized nations devoted to the growth and preparation, the elaboration and ultimate manufacture of the various fibrous and textile materials used for clothing, and of the implements and machinery subservient thereto. A large proportion, also, of the internal and foreign trade of the most commercial States consists in the exchange or distribution of the materials for clothing, either in the raw or manufactured state. In the primitive and simple states of society, where public and individual wealth is more limited, all the arts relating to this industry partake more of a strictly domestic or household character. The materials are more coarse and durable, being, to a great extent, spun and woven in the family, where they are often made up with but small aid from the clothier and tailor. Such, to a great extent, was the case in the early history of most of these States, when the straitened pecuniary means and the undeveloped state of all the domestic arts imposed upon all classes a compul-

sory frugality in regard to apparel. In portions of the country, moreover, an austere public sentiment enjoined a rigid simplicity of dress, which was often enforced by legal penalties. Tailors were among the needful tradesmen in the first colonization of all the States; but in many the art and mystery of their calling, which, in its highest exercise, approaches to the dignity of a fine art, found but a limited field.

A recognition of the services of this useful class occurs in connexion with one of the earliest notices of the use of cotton in this country. A public order of the colony of New Haven in 1643, soon after its settlement, required the tailors to see that every family was provided with "a coate of cotton woole well and substantially made." In the following year the functions of the craft were again called into exercise for the public safety in a curious order requiring, under penalty, that so soon as canvas and cotton could be obtained from abroad, "every family within the plantation shall accordingly provide, and after continue furnished, with a coate well made, and soe quilted with cotton woole as may be fit for service and a comfortable defence against Indian arrowes, and the taylors about the town shall consider and advise how to make them, and take care that they be done without unnecessary delay."

Although the first fulling mill in America was erected about the year first named at Rowley, in Massachusetts, we are told that in 1713 there was but one clothier in Connecticut, who could do little more than full a portion of the homespun cloth made, much of which was worn unshorn and undressed. During a greater part of the colonial period much of the materials for clothing for the wealthier classes, and all the finer cloths, were imported from England. Tailoring establishments found ample patronage in all the larger cities, towns, and villages, and were sometimes flourishing concerns. In Philadelphia, which took an early lead in social and commercial importance, we find the tailors, as early as 1718, applying for an act of incorporation by the city government. A "Master Taylor's Society" was incorporated in that city in 1805, and a benevolent society of journeyman tailors, instituted in the year 1800, was incorporated in the year 1807. Although similar associations for mutual aid were formed in other places, confederations of particular interest, or trades' unions, which in some countries have been successfully employed by this respectable class of tradesmen and others as a means of keeping up the price of wages, generally at the expense of other trades, or of the public interests, have not been much resorted to in this country. The wages of labor have generally been adequate under the operation of the natural laws of trade. The needle-women, by whom, under the modern system of wholesale manufacture of slops and clothing the principal part of the work has been done, have sometimes found prices inadequate for a comfortable support. The recent introduction of the sewing-machine, as would appear from the schedule, has reduced the number of sewing women, and their sudden displacement in some places may have been injuriously felt without, on the whole, damaging their interests as a class.

The revolution in the tailoring business, which has created the ready-made clothing trade as a distinct branch of business, began about thirty-five years ago. A few establishments in New York and one or two other principal cities, the largest of them employing three to five hundred hands each, were at that time engaged in shipping clothing to the southern States and to foreign ports. The ready-made clothing kept for sale previous to that consisted principally of "slop work" for seamen, some of which was imported.

The duty on clothing imported ready-made from abroad, imposed by the tariff of 1816, was 30 per cent. ad valorem. In May, 1828, the duty was raised to 50 per cent. on all except articles of silk, at which rate it remained until 1846, when it was again reduced to 30 per cent. In 1857 the duty was still further reduced to 24 per cent., but in 1862 was increased to 35 per cent.

The average annual value of ready-made clothing exported from Great Britain to the United States in the years 1827 and 1828 was £159,724 sterling. During the next six years the average annual value of apparel, slops and haberdashery exported to this country was £102,926 per annum; and for the ten years ending in 1844 the annual value was £160,605. The imports of ready-made clothing for the years 1851 and 1852, from all countries, averaged \$97,032. The exports of American manufactured clothing, on an average, of the two years ending 30th September, 1828, was \$119,510. During the next five years it amounted annually to \$75,576; and for the ten years from 1833 to 1843 the average

yearly exports of clothing amounted to \$118,730. In the years 1851 and 1852 the exports of clothing from the United States amounted to an average of \$250,102 per annum. The largest exportation was in the year 1838, when it reached the sum of \$259,194, and the smallest in 1843, when it was only \$23,227.

The domestic market has been the chief dependence of the wholesale clothing trade. This branch had become only partially established in New York and one or two other cities previous to the financial troubles of 1837. In consequence of the large amount of capital required, and the length of credit given, many of the clothing houses were prostrated during the crisis. The trade revived, however, in 1840, and became rapidly established and extended as a distinct branch of the dry goods trade. In 1841 the value of clothing sold at wholesale in New York was estimated at \$2,500,000. The State census of 1855 returned 126 tailors' shops in that city, employing 12,968 persons, and expending annually for raw material \$4,317,302, with a manufactured product of \$7,592,696. The value of the product was estimated much higher. The State, in that year, produced tailors' work to the value of \$11,842,929, requiring 3,421,642 yards of cloth. The value of clothing returned by New York city in 1860, exclusive of Brooklyn and Williamsburg, was \$17,011,370. The value of clothing manufactured, including neckties and suspenders, in Massachusetts, in 1837, was only \$2,013,316. In 1855 the value of clothing made in Boston alone, including custom-work, was officially returned at \$3,500,000, and, as in the case of New York, it was estimated from twelve to fifteen millions annually. The value reported in 1860 was \$4,567,749. Cincinnati has also been among the largest producers of ready-made clothing. In 1840 the value made in that city was \$1,940,450. In 1850 it amounted to \$4,427,500, and in 1860 to \$6,381,190. Philadelphia produced clothing in 1860 to the value of \$9,984,497. The four cities above named manufactured more than one-half the total product of the Union in 1860. Baltimore, Louisville, St. Louis, and some other cities, have a large wholesale clothing trade, which, in Baltimore, amounted, in 1860, to \$3,124,081.

The business has now become widely distributed throughout the country, as appears from the statistics. Its extension has wrought an important change in the dry goods trade. The importation and sale of foreign and domestic cloths has fallen, in a measure, into the hands of wholesale clothing merchants, who thus unite the jobbing business with that of manufacturers and dealers in clothing on a large scale. These branches, in consequence of the high cost of the materials, the long credits given, and other circumstances, require heavy investments of capital, and the greatest discrimination and judgment in the selection of goods, a particular acquaintance with the wants of different localities and classes of customers, in order to the selection and adaptation of styles suited to each. The same discrimination and taste is a constant element in the success of the country merchant and retailer, who are enabled to dispense with stocks of piece-goods by reason of the facility with which supplies of ready-made clothing, adapted to their peculiar trade, may be selected and sold, cheaper than they can be manufactured on the spot. The general diffusion of wealth enables the American people of all classes to be comfortably and respectably attired, and it is seldom that one class is compelled to wear the cast-off clothing of another, as in countries where the poor are more numerous. Hence, the vast demand for ready-made apparel of moderate cost has developed an enormous and growing trade, giving employment to multitudes of women in the large cities, where they stand most in need of profitable employment. So extensive have some of the wholesale clothing houses become, that several thousand persons have been employed by a single establishment. The male hands have been principally German and Irish immigrants, the cutters being principally American. The wages have almost uniformly been greater than the same class could earn in Europe. The females employed in this branch have generally been better paid than needle-women in European cities. Although there have doubtless been exceptional cases of oppression practiced by a few avaricious employers toward this dependent and deserving class, it is certain that the charge of overwork and underpay cannot be made against the manufacturers as a class. The sewing machine has now been extensively employed in this business for several years, and has given a vast impetus to the trade. It has done this, not only by cheapening the cost of

## INTRODUCTION.

lxv

production, but by enabling the manufacturer to turn out his work with greater rapidity, and thus accommodate his stocks to the peculiar state of the market. As many sewing women also possess themselves of these machines, they are enabled to counterbalance any reduction in the price of work by its increased amount. Others are, by the same means, enabled to live in the country, or at a distance from the crowded avenues of the city, and yet to receive and return, at stated times, a larger amount of work than they could turn out with the needle. Their use has undoubtedly contributed to make the large wholesale clothing houses of our chief cities the palatial establishments which they have now become, rivalling in extent and completeness those of any other branch of trade. The establishment of M. Godillot, in Paris, considered, a few years since, the largest clothing factory in the world, employed sixty-six sewing machines, kept in motion by a steam engine of nine horse-power, which sewed all the clothing of the Crimean army. A cutting machine, invented by Dussantey, the Emperor's tailor, and capable of cutting out fifteen suits at once, and one thousand women and girls were also employed in the establishment.

**BOOTS AND SHOES.**

The manufacture of boots and shoes employs a larger number of hands than any other branch of American industry save that of agriculture, and more than one-twelfth of all the operatives engaged in manufactures. Although the returns show a decrease of 4,438 in the number of females employed, as compared with the census of 1850—in part attributable to the increased use of sewing machines—yet there was an increase of 22,163 in the number of male hands, and a total of 123,029 persons engaged in this business on the first day of June, 1860, whose annual wages amounted to \$30,938,920. The number of establishments devoted to the manufacture of boots and shoes was 12,487, which employed a capital of \$23,358,527, consumed raw material worth \$42,729,649, and produced goods to the value of \$91,891,498. The total product of this industry was 70 per cent. above that of 1850, when it amounted to \$53,967,408, the increase being \$37,924,090. Of the whole number of establishments, 2,439 belonged to New England, 5,412 to the middle States, 3,175 to the western, 1,365 to the southern, and 96 to the Pacific States.

The New England manufactories were, relatively, much the largest. They gave employment to nearly \$11,000,000 of capital, and to 52,010 male and 22,282 female hands, the annual product of whose labor was \$54,818,148, or nearly 60 per cent. of the whole value of this branch—an increase of \$24,870,823, or upward of 83 per cent. on the product of those States in 1850. The average value of boots and shoes made in the New England factories was \$22,475. More than one-half, or 1,354 of those establishments were in Massachusetts, and they employed over \$9,000,000 of capital, 43,068 male and 19,215 female hands, the product of whose labor amounted to \$46,230,529, having increased its value 91.8 per cent. The average capital of the Massachusetts factories was \$6,655, the number of hands 46, and the value of annual product \$34,143.

New Hampshire was second among the New England States, having produced to the value of \$3,864,866 in 337 manufactories, an increase of 48 per cent. Connecticut returned over \$2,000,000 in value as the product of 212 factories, an increase of only 10.3 per cent., while Maine increased its manufactures of boots and shoes 98.7 per cent., being the third in rank. Rhode Island produced an annual value of \$315,759, an increase of 35.7 per cent. upon the returns of 1850.

In the middle States, New York and Pennsylvania are the leading producers. New York had 2,277 factories, employing 13,868 male and female hands, whose labor produced boots and shoes to the value of \$10,925,173, an increase of 40.5 per cent. Pennsylvania returned 2,181 establishments, with 13,389 hands, and an annual product of \$8,474,127, the increase being 50 per centum. There was a slight decrease in the product of Maryland. The total value of boots and shoes in the middle States was \$22,976,783, an increase of 36.9 per cent.

In each of the western States the returns showed an increase of more than fifty per cent. over those of 1850. Their aggregate manufacture of boots and shoes amounted to \$9,867,807, an average increase of 91.9 per cent. in ten years. Ohio took the lead, having 1,077 establishments, which employed 4,706 hands, and produced goods to the value of \$3,662,831, the increase being 57.8 per centum. Indiana and Illinois each returned an annual value of upwards of one million, an increase in the former of 114 and in the latter of 136.6 per cent. Michigan and Wisconsin, in each of which the manufacture of boots and shoes fell a little short of one million dollars in value, increased their product in the ratio of 88.8 and 214.9 respectively.

In the southern States there was an increase of this manufacture equivalent to 89.9 per cent., the aggregate value being \$3,973,313. South Carolina was the only State which showed a falling off from the product of 1850, while in Louisiana, the largest producer, the increase was 262 per cent., and the total value \$1,472,830. In Texas, Florida, Arkansas, and Mississippi the value of manufactures, though small, was greater than that of 1850, in the ratios, respectively, of 334, 244, 142, and 98.2 per cent. In Virginia, the second in the extent of this business, the increase was 23.2 per cent.

The Pacific States, which have come into existence since the previous census was taken, manufactured boots and shoes in 1860 to the value of \$255,447, of which amount more than one-half was the product of 70 manufactories in California.

In further review of these returns, we cannot but be impressed with the magnitude and importance of this business to the laboring and commercial classes in New England, where *its aggregate value in 1860 exceeded by \$850,740 the total production of all the States in 1850*. The increase alone in the single State of Massachusetts was nearly equal to the entire production of the middle States, which was itself an advance of nearly 37 per cent. on the returns of 1850. This increased production in all sections was in a great measure due to the use of the sewing machine and other mechanism now employed extensively in the business, in many instances propelled by steam. The counties of Essex, Worcester, and Plymouth, in Massachusetts, severally manufactured boots and shoes to the value of about \$14,500,000, \$9,500,000, and \$9,250,000, considerably more than one-third the total product of the Union. The highest value manufactured in any one place was in Philadelphia, where it fell little short of \$5,500,000. Lynn, Massachusetts, turned out boots and shoes, chiefly ladies' wear, to the value of upward of \$4,750,000, and Haverhill, Massachusetts, considerably over \$4,000,000 worth. The city of New York stood next in order, its manufacture amounting to more than \$3,750,000. These four cities inclusive manufactured about one-fifth the total value of boots and shoes made in the United States, or upward of \$18,250,000. The largest single establishment in this business was one in North Brookfield, Massachusetts, which manufactured to the value of more than \$750,000. It was the largest of five manufactories belonging to the same proprietors, which unitedly, in 1860, made more than 1,000,000 pairs of boots and shoes, valued at upwards of \$1,250,000.

#### HISTORY OF BOOT AND SHOE MANUFACTURE IN AMERICA.

The introduction of the present style of shoes was nearly coincident with the first settlement of New England, and with the first implanting there of an art which now forms its predominant industry. A great diversity of forms and materials for coverings for the feet have prevailed among different nations and at different periods of the world's history. In England for a long period, extending into the middle ages, the prevailing fashion of boots and shoes was characterized by long pointed or beaked toes, which at length became so excessive as to require the points to be tied up to the knee. An edict of Edward III, in 1365, restricted their length for the unprivileged classes to two inches, under penalty of a forfeiture of 20 shillings by the shoemaker, to which it was found necessary to add excommunication by the clergy. This restraint upon the length produced a corresponding extension of the breadth of the toes, which in its turn called forth a proclamation of Queen Mary that the toes of shoes should not exceed six inches in width. During the civil wars shoes were decorated with red or green rosettes, which about the year 1668 gave place to buckles; and these again were abandoned about 1791 for shoe-strings, as worn at present. In the time of Cromwell boots were worn with high and very wide tops of yellow or scarlet leather, sometimes adorned with lace. At the Restoration the long French boot was introduced, and at a later period *red heels* became a mark of gentility. About the year 1633 shoes of the present shape, with round toes, were adopted. But wooden and cork shoes, or pantofles, bearing the wearer two inches above the ground, were common, and as late as 1717 were prohibited by Frederick William II, of Prussia, as an injury to the trade of shoemakers. Cloth or stuff shoes were much worn by the wealthier classes, and, during the early part of the last century, shoes of silk or velvet were still preferred by ladies, those of the court using figured blue silk, with bright red heels and silver buckles. The gaiter boot is said to have been introduced from France at a later date by the Countess of Blessington. Through the ingenuity of American artists its troublesome arrangement of lacings, tags, and eyelet holes has been superseded by the use of an elastic webbing, rendering the elastic gaiter, or Congress boot, at once the most comfortable, elegant, and popular style of shoe or boot. In its manufacture, as well as in other branches of the trade, our workmen now rival the best foreign artisans, and have almost entirely suspended the importation of French gaiters, at one time quite extensive

In tracing the initial step of this vast industry in our country, we find that in 1629, the second year of the settlement of Massachusetts, a shoemaker named Thomas Beard took passage on board the *Mayflower*, with a supply of hides, being accredited to the governor of the colony by the company in London, at a salary of £10 per annum, with the recommendation of a grant of fifty acres of land, where he should be directed to settle. In 1635 the business was first commenced at Lynn by Philip Kertland, a native of Buckinghamshire. Within fifteen years the shoemakers of the town were able to supply the merchants of Boston with shoes for their trade. These were chiefly of calfskin, morocco being then unknown there. As early as October, 1648, the shoemakers of the colony were invested by the general court with the privileges of an incorporated company, or guild, with power to regulate their trade for three years. About the same date, also, we find tanning and shoemaking named among the established industries of Virginia; one Captain Matthews, an early planter, being especially mentioned as employing eight shoemakers upon leather tanned and dressed on his own premises. The business of the cordwainer was placed under legal restraint in Connecticut in 1656, and in Rhode Island in 1706. In New York the tanners and shoemakers had become so firmly established previous to the capitulation of the province to the English in 1664 as to give distinctive names to localities occupied by them in what is now the business centre of the city. In 1698 we find these useful classes, with others dependent upon them, profitably employed in Philadelphia, then in its infancy. Journeymen shoemakers received 2s. per pair for making men's and women's shoes; last-makers 16s. per dozen for lasts; and *heel*-makers 2s. per dozen for wooden heels, an article which continued in use for many years after. In 1721 shoemakers in Pennsylvania were prohibited by act of assembly from taking more than 6s. 6d. for a pair of good, plain, well-made men's shoes, and 5s. for women's. The same act prescribed the manner of making them, and forbade the use of neat's and calf leather in the uppers of the same boot or shoe, or any sheepskin uppers when made for sale.

The earliest improvements in the domestic manufacture of shoes were made about the year 1750 by John Adam Dagyr, a Welchman, who settled in Lynn, where the business was as yet quite limited, only three persons employing journeymen. He possessed superior skill in making ladies' shoes, and by his instructions the native workmen—who had frequently taken apart the best English shoes in order to learn how they were made—were soon able to make shoes nearly equal to those imported. The business in Lynn was thenceforward, as at present, chiefly confined to the manufacture of women's shoes. In 1764 the *London Chronicle* stated that women's shoes were made in Lynn, "exceeding in strength and beauty any that were imported from London." Boots were little worn before the war of Independence, and the shoes of servants, both male and female, were almost exclusively of coarse neat's leather. No inconsiderable part of the boots and shoes worn in the country at the date of the Revolution was of domestic manufacture, chiefly the production of Massachusetts, which supplied many for the army during the war. The heavy importations which followed the peace nearly prostrated this infant industry, which, however, so far revived in Lynn that 100,000 pairs were exported from the town in 1788. In 1795 Lynn employed 200 master workmen and 600 journeymen and apprentices in the shoe business, and sent 300,000 pairs of shoes chiefly to southern markets. Through Boston and other cities it sent also small quantities to Europe.

In 1810 the consumption of foreign boots and shoes of all kinds amounted to only 15,861 pairs, chiefly kid and morocco; the exports of home-manufactured boots was 5,169 pairs; and of shoes, 54,835 pairs, showing that in this branch we had become entirely independent of foreign countries, and had a surplus for exportation.

The census of that year embraced returns of this manufacture from only eleven States, in which the aggregate number of boots, shoes, and slippers made was 5,035,371 pairs, valued at \$4,686,624. Of that product, 2,218,671 pairs, worth \$2,201,792, were made in Massachusetts, chiefly in Essex and Middlesex counties, and 1,327,776 pairs, of which the value is not separately given, in Pennsylvania—more than one-half in Philadelphia city and county. Vermont, which was second among the New

England States in the boot and shoe manufacture, returned 65,580 pairs of boots, averaging \$3 a pair in value, and 238,700 pairs of shoes, worth 75 cents per pair. New Jersey was the second of the middle States in the value of its boots and shoes, which amounted to \$427,685, chiefly the product of Essex county and of the town of Newark, which had been long noted for its boot and shoe manufactures, and in which the first shoemaker, William Whitehead, settled about the year 1676.

Mr. Tench Coxe, in 1812, estimated that the boots, shoes, and slippers manufactured in that year "undoubtedly exceeded the value of all the foreign manufactures imported in the first year of the present government, which, by the actual returns of November 30, 1791, were worth here only \$15,293,638;" and that, "were shoes, boots, and slippers manufactured in the same proportion to numbers in all the States, as in Massachusetts, they would be equal in value to \$25,067,000.\*" He stated, also, that an improvement in making shoes, which saved four-fifths of the workmanship, had been discovered. At that date few improvements had been made in the process of manufacturing shoes, and machinery had scarcely been called to the aid of the maker. The London Society of Arts, in 1802, and again in 1812, awarded premiums for machines to enable shoemakers to work in a standing position, thereby relieving the pressure upon the breast and the constraint of position, which are so detrimental to health. The invention referred to by Mr. Coxe was probably that of D. M. Randolph, of Richmond, Virginia, who, about the year 1809, introduced a method of uniting the soles and heels to the uppers by means of rivets instead of sewing them. This was effected by covering the bottom of the last with a plate of metal, against which the nails were clinched when driven through the two soles, and the upper united over it. John Bedford, of Philadelphia, in July, 1806, took out a patent for manufacturing iron-bound boots and shoes, whereby it was claimed that a saving was made in leather, and, in consequence of the greater durability of the work, and the disuse of thread, of more than one-half the material. A patent was also granted in 1812 to Ephraim Twombly, of Massachusetts, for making iron-bound boots and shoes.

The first large manufactory in which machinery was employed in the manufacture of boots and shoes was that established at Battersea, in England, by Brunel, the celebrated engineer, for the supply of shoes to the British army during the last war. The labor was performed by the Chelsea pensioners, and the process employed was that of riveting the soles by double rows of small nails, the bottoms being at the same time thickly studded with copper or iron nails. The ingenious proprietor, who had a patent, contrived many other small machines for cutting out and hardening the leather by rolling, punching the holes, forming and inserting the nails, &c., some of which are still used in France. But the method appears to have fallen into disuse after the peace in 1815, probably on account of the cheapness of manual labor.

The manufacture of pegged boots and shoes, which now forms the greater proportion of the work of our factories, and the greatest improvement yet made in the business, as far as labor is concerned, was practiced as early as 1812 in New York, and very generally in Connecticut, although this valuable invention has been ascribed to Joseph Walker, of Hopkinton, Massachusetts, about the year 1818. We find that a patent for a method of pegging boots and shoes was taken out in July, 1811, by Samuel B. Hitchcock & John Bement, of Homer, New York, and another by Robert U. Richards, of Norwalk, Connecticut, in May, 1812, for the use of wooden pegs, screws, &c. Samuel Milliken, of Lexington, Massachusetts, in 1807, took out a patent for metallic bottoms for boots and shoes. A pegging machine was the subject of a patent by Nathan Leonard, of Merrimack, New Hampshire, in June, 1829. Other contrivances for the same purpose were brought forward at different times, among which may be mentioned the ingenious machine for pegging boots and shoes patented in 1851 by A. T. Gallahue, of Pittsburg, Pennsylvania, where it was put in practical operation. It enabled one man to peg a boot or shoe with two rows of pegs on each side in three minutes, cutting its own pegs at the same time. In the following year patents were issued to Mr. Gallahue for a further improvement, and to seven other different persons for shoe-pegging machines. The pegging machines of Sturdevant and of Tripps & Hill have proved useful inventions. Several minor inventions have materially contributed to the

\* Statement of the Arts and Manufactures of the United States, &c.

extension of the pegged shoe and boot manufacture, which now constitutes at least three-fourths of the general business. Among these are the various machines for cutting, pointing, setting, and driving the pegs, for punching the holes, &c. In 1839 a peg and last factory, three stories high, was erected at Dayton, Ohio, which made 20 bushels of shoe pegs and 500 lasts per week. A large establishment was also in operation in 1841 at Meredith Bridge, (now Laconia,) New Hampshire, for making pegs by machinery, on which the proprietor, M. H. Baldwin, had secured a patent. The pegs were made of white, yellow, and black birch, and white maple. They were of different sizes and qualities, and were made at an average price of a little over two dollars per bushel. This manufactory for many years furnished the principal supply of pegs for the country, and in 1850 produced about 50 bushels of pegs per diem. The value of shoe pegs made in the State in 1845 was \$18,206. Among the shipments from Boston to Liverpool in the first week of September, 1861, were 383 barrels of shoe pegs, chiefly destined, it is probable, for the continent, where large quantities are now consumed in the manufacture of German toys. During the same year a steam peg manufactory was started at Bloomington, North Carolina, by Mr. A. U. Tomlinson, for the supply of the south, which had previously been supplied by New England. An association in New York, called the American Union Company, with branches in the country around, was formed in 1850 for the manufacture of "staple or pegged boots and shoes," the demand for which exceeded the supply. Much saving of labor has also been effected in the manual process of this manufacture by the little invention called the pegging or awl haft, patented by Aiken & Hemenway, and by the several processes for rolling, cutting and crimping the leather, and for the manufacture of lasts, all of which have been the subjects of numerous patents.

**LASTS**—A patent for manufacturing shoemakers' lasts was issued in 1807 to William Young, of Philadelphia, and another in 1817 to the same for making right-and-left lasts. But the lathe for turning irregular forms, by which lasts are now made on a large scale with facility and cheapness, was the invention of the late Thomas Blanchard, a native of Sutton, Massachusetts. Originally designed for turning gun-stocks and other objects of irregular form, it has since received a wide range of applications. It turns lasts in complete sets, including all the sizes, and for both feet, from a single pattern, by a simple adjustment of the machinery. Patents were taken out by the inventor in September, 1819, and in January, 1820, which were renewed by act of Congress in 1834, and again in 1847. A valuable improvement upon lasts was made about the year 1827 by John Kimball in cutting blocks from the upper and anterior part of the last according to rules which he laid down, a system which has continued in use ever since, with much satisfaction to the trade.\* The value of lasts and shoe pegs made in Massachusetts in 1845 was \$98,351. In 1855 there were made in that State 1,099,336 lasts, worth \$179,450, and 17,800 bushels of pegs, worth \$12,900.

A system of diagram *patterns* for cutting was introduced in 1832 by Mr. Richardson, of Boston, and has since been adopted generally throughout the country, with manifest benefit, in the manufacture of shoes by machinery.

A machine for draughting, cutting, and blocking boots was patented in 1847 by S. C. Shire, of Pennsylvania, which has been found useful by many manufacturers.

But the crowning invention which has supplemented and given practical value to all other kinds of machinery in the manufacture of boots and shoes is the **SEWING MACHINE**. Its use has introduced a new era in the trade. Without it the partial use of machinery upon the bottoms of boots and shoes was attended with little economy, because the cost of stitching and binding the uppers, which was the larger item of expense, was not reduced in a corresponding degree. Although of quite recent introduction in this branch of industry, its employment, along with the sole-cutting machine, and other appliances, is gradually bringing about a silent revolution in the boot and shoe manufacture, which is daily assuming the characteristics of a factory system, being conducted in large establishments of several stories, each floor devoted to a separate part of the work, with the aid of steam-power, and all the labor-saving contrivances known to the trade. It is safe to predict that this change will go on until the little

\* Richardson's Boot and Shoe Manufacturer's Assistant and Guide.

"workshop" of the shoemaker, with its "bench" and "kit," shall become a thing of the past, as the "hand-card" and the great and little "spinning wheel" have disappeared from other branches of the clothing manufacture.

As a branch of domestic trade the boot and shoe business dates its commercial importance from about the year 1818, in which the first full cargo of boots and shoes was shipped from Boston on board the sloop *Delight*, consigned to Spofford, Tileston & Co., commission merchants, 131 Fly Market, New York. The firm, at that time the largest boot and shoe jobbers in that city, then commenced shipping them from that port instead of Boston, which had previously engrossed the trade. The business was rapidly increased and fostered in other States, the growth of the manufacture having previously been confined chiefly to New England. In 1828, however, the entire value of the jobbing trade of Boston, which was its commercial centre, amounted to but little over \$1,000,000, and the jobbing-houses of New York in the following year numbered only four. In 1856 Boston contained upwards of 200 wholesale and jobbing-houses, and the domestic and foreign shoe trade of Massachusetts amounted to nearly \$50,000,000. The shipments from Boston to San Francisco alone, in that year, were 42,258 cases, valued at \$2,100,000. New York in 1858 contained 56 wholesale and 600 to 800 retail boot and shoe houses. The sales of the former amounted to about \$15,000,000, and of the latter to upwards of \$5,000,000. In 1863 the exports of boots and shoes from New York to foreign countries consisted of 11,418 cases, worth \$937,911. It has also a large export trade in boots and shoes to California.

About the year 1829 the wholesale houses in Boston introduced a new system of business, which has rendered that city the great emporium of the trade in New England. Previously it had been the custom for dealers to consign their goods, on their own account, to merchants in the principal cities of the United States and the West Indies. This was found to be unprofitable when competition had grown strong, and led to the failure of many of the large houses. During the last thirty years or more, it has been customary for the large manufacturers and jobbers to sell their goods at their places of business, thus compelling the market to come to their doors instead of seeking it themselves. The financial embarrassments of 1857-8 severely tested the vigor of this branch of trade, which was found to withstand the shock equal to any in the country.

The staple articles of this heavy domestic trade, which has now grown to be the largest in the Union, consists chiefly of men's and women's pegged boots and shoes, and brogans. Large quantities of the latter were formerly sold to the southern States for negro wear. During the present war the demand for strong army shoes has largely supplied the loss of the southern trade. This class of work is chiefly produced in Maine, New Hampshire, Massachusetts, and Connecticut. Women's pegged and common sewed shoes and gaiters are manufactured at Lynn, Haverhill, Worcester, Milford, Natick, Randolph, Abington, North and South Reading, Danvers, Georgetown, Stoughton, Woburn, Weymouth, Stoneham, and other towns in Massachusetts, several of the towns first named making each from three to five millions' worth annually. Boots are also made in each of them except Lynn, but form a leading article of manufacture in Haverhill, Milford, Worcester, North Brookfield, Spencer, Grafton, Randolph, Stoughton, Weymouth, Hopkinton, South Reading, and Abington. The number of boots made in the State in 1845 was 3,768,160 pairs, and of shoes 17,128,411 pairs, nearly all by hand-labor, of which the total value was \$14,799,140. The State census of 1855 returned 11,892,329 pairs of boots, and 33,174,499 pairs of shoes, valued together at \$37,501,723.

Boots and shoes of a finer quality are made in New York and Philadelphia. The latter city possesses some advantages for the production of a fine description of boots and ladies' shoes, on account of the large stocks of fine calfskins and morocco leather—in the manufacture of which that city has long enjoyed a high reputation—and also in the number of its skilful German workmen. Its domestic manufacture amounts in value to \$5,472,587, and its annual sales to about \$15,000,000.

# INTRODUCTION.

## INDIA-RUBBER GOODS.

Boots, shoes, clothing, and other water-proof and useful articles from caoutchouc, or India-rubber, are extensively made in several of the States. Few branches of our varied industry are more remarkable for rapidity of development, for the quick succession of new processes introduced, and for the very numerous important uses to which, within the short space of twenty-five or thirty years, a single raw material has been applied in nearly every department of art, science, and domestic economy. a single raw material has been applied in nearly every department of art, science, and domestic economy.

When we consider the almost inconceivable number of articles of ornament or utility made of hard or soft rubber, and of gutta-percha, so nearly allied to it in properties, we can scarcely overestimate the amount of substantial benefit to the nation, represented in an aggregate product of more than \$5,750,000 worth of such articles in a single year. So multifarious is the application of these materials that the mere statement of the nominal value of the manufacture but imperfectly measures its influence upon the health, comfort, and progress of the people among whom its products are distributed.

The value of India-rubber goods made in 1850 was \$3,024,335. In 1860 it amounted to \$5,642,700, an increase of \$2,618,365, or 86.6 per cent. The capital invested in the latter year in 27 establishments was \$3,534,000; the cost of raw material \$3,056,360; the number of hands employed, of whom 973 were females, was 2,768, and their annual wages cost \$794,570. With seven fewer establishments than were in operation in 1850, and a very small increase in the number of hands, this business shows an appreciation of its aggregate capital in the ratio of nearly 143 per cent.; in the cost of material, of 90 per cent.; and in annual wages, paid, of nearly 48 per cent. in ten years. In 1850 Maryland made returns from two and New Hampshire from one small factory, which have ceased to exist. New York, in 1860, had three and New Jersey one factory less than in 1850, the only increase being one in Connecticut.

Of the entire product, upward of 40 per cent., or \$2,276,000, was made in the nine manufactories of Connecticut, exhibiting an increase of 86.8 per cent. in the business of that State. New Jersey produced upward of \$1,200,000 worth of rubber goods, and New York over \$1,000,000, the increase in the former being 80 per cent., and in the latter 82.6 per cent. Massachusetts held the fourth rank in this branch, but showed the highest ratio of increase, which, though on a small amount, (\$803,000,) was 190.9 per cent. over its product in 1850. Rhode Island fell a little below \$250,000 in the value of its rubber manufactures, having only increased the amount 14.7 per cent., while Pennsylvania shows a falling off in its product, which was never large.

## HISTORY AND STATISTICS.

Caoutchouc, gum-elastic, or India-rubber, and some of its uses, have been long known in South America and the East Indies. In the former it is called by the natives *cauchou*. It is obtained from several parts of the country, but most abundantly from the province of Para, in Brazil. It is chiefly produced by a tree variously named by different naturalists as *Jatropha elastica*, *Siphonia elastica*, *Hevea guianensis*, &c. It exudes as a milky juice from incisions made in the bark, and afterward dries into the concrete, elastic caoutchouc. It is imported chiefly in the form of pear-shaped bottles, shoes, half-boots, &c., made by spreading successive layers of the fresh juice over moulds of clay and drying in the smoke of a species of palm-nut, after which the moulds are broken, and the fragments shaken out. It is also imported more cheaply as *sheet-rubber*, in rough, irregular sheets, two inches thick and two feet long by one foot wide. For several years past it has also been obtained in a liquid form, though quite impure, and at high cost, in tightly closed vessels of copper or India-rubber, for which, in 1853, Mr. H. L. Norris, of New York, substituted air-tight vessels of glass and tin, for which he secured patents in England and the United States. The Asiatic trees, which now furnish the principal supply of a similar material, are the *Ficus elastica*, a very large tree, of which immense forests exist in Assam, beyond the Ganges, the *Urceola elastica*, and perhaps others. The product of these comes to us in a very impure state; but Mr. A. S. Day, of Connecticut, several years ago, patented and put in operation at Seymour,

in that State, expensive machinery for freeing it of the sand, bark, and other impurities. The euphorbia, poppy, lettuce, chiccory, and other European plants, are said to furnish caoutchouc, or elastic gum.

Caoutchouc was first made known to Europeans by the French academicians sent to Brazil in 1730. One of these, M. de la Candamine, in 1736, presented to the Academy of Sciences an account of its uses by the natives of South America. In 1761 MM. Herissant and Macquer made a report, accompanied by samples, to the French government, and by its order M. Grossart made a number of experiments, in which he at length succeeded in drawing caoutchouc into tubes. The results were published in 1798. About the same time it was used to make extensive ligatures and springs of different kinds. Fourcroy discovered its partial solubility in ether, and in 1820 Nordler cut it into threads suitable for the manufacture of elastic tissues.

The first English work in which this substance is mentioned is that of Dr. Priestley, on the "Theory and Practice of Perspective," printed in 1770, in which he states that after the printing of his book he was shown "a substance excellently adapted for wiping out from paper the marks of a black-lead pencil." It was sold by Mr. Nairne, a mathematical instrument maker, at the rate of three shillings for a cube of about half an inch. From that time it appears to have taken the name of India-rubber, in reference to that use of it. Ten years later it had come into more general notice, and was sold in the shape of bottles, at about a guinea the ounce. A Scotch publication, in 1791, contained an article "on the uses that may be made of caoutchouc, elastic gum, or India-rubber, in the arts and manufactures, with an account of the manner of obtaining and manufacturing it." Its application to a great number of its present uses was therein foretold and recommended, although the substance was then little used except as an amusing toy or to erase pencil-marks.

In 1797 a patent was taken out in England by a Mr. Johnson for rendering cloth water-proof by covering one side with a varnish made of India-rubber dissolved in equal parts of oil of turpentine and spirits of wine, and sifting over the surface silk, wool, flock, or other substance, to conceal the varnish. These fabrics, called *hydrolaines*, do not appear to have come much into use. The strong affinity of caoutchouc for the essential oils was early discovered, as well as its perfect solubility in washed ether; but most of these solvents, as also the liquid hydrocarbon, called *caoutchoucine*, distilled from crude caoutchouc, and patented in 1833 by Barnard, were too costly and dried too slowly for making varnishes for ordinary use. Professor Syme, of Edinburgh, discovered that it was readily dissolved in naphtha, and recovered its elasticity again when dried. Naphtha, distilled from coal-tar, was found to answer the same purpose and to be cheaply produced.

The first practical application of this knowledge in the manufacture of water-proof cloth was effected by Mr. Mackintosh, of Glasgow, who dissolved caoutchouc in naphtha from native petroleum or from mineral tar, and applied the solution as a varnish to the surfaces of two pieces of cloth, which were afterward laid together and pressed between rollers. For this process, which is similar to that by which the natives of South America manufacture *ponchos* with the liquid juice, the inventor obtained a patent in 1823, and the garments made of these water-proof double fabrics were long known as "Mackintoshes." He established the first India-rubber manufactory in Great Britain, if not in the world. This fabric was also used for making the water-beds of Dr. Arnott, nursery aprons, &c., and likewise for boats, by stretching it over wicker frames. This application of the material gave a strong impulse to the manufacture.

As early as 1813 a patent was taken out in the United States by Jacob F. Hummel, of Philadelphia, for a varnish of gum-elastic, and in 1824 Charles Baganelle Fleetwood, in England, was granted letters patent for a liquid composition for making leather water-proof, consisting of India-rubber and beeswax or other gummy matter combined through the agency of spirits. But all the solutions of India-rubber in the common essential oils employed for rendering cloths and leather water-proof either did not dry well, or, when dried, by the addition of linseed oil, were found to be flexible, but inelastic, and after a time became brittle and cracked.

A process capable of numerous practical applications was pointed out in the infancy of the manufacture by the late Professor J. K. Mitchell, of Philadelphia. By immersing caoutchouc bags in common ether, containing no oil of wine and little alcohol, he was able to blow them into thin balloons, light enough to float in the air. In this state caoutchouc could also be stretched over forms, and, when dried, did not return to its original shape. It could likewise be rolled or pressed into sheets of any size and degree of tenuity. This knowledge was made available in the flature of caoutchouc for the manufacture of elastic fabrics, such as braces, garters, bands, &c. The manufacture of these articles appears to have originated with an officer in the Austrian service, who afterward established a large manufactory at St. Denys, near Paris. The threads were at first cut from the original pear-shaped bottles with scissors, at the rate of 100 yards a day, and afterward from the inflated bottles, which afforded a finer thread. In 1826 or 1827 Messrs. Rattier & Guibal, proprietors of the St. Denys factory, employed machinery for cutting the filaments, and made fabrics of great beauty. Subsequently machines for this purpose were patented in England by Westhead, of Manchester, Mr. Nickels, and others, which cut them from a flattened disk of rubber, varying in fineness from 700 yards to 5,000 yards to the pound. The finer threads were used for ladies' silver and gold elastic bracelets, bands, &c., and the coarser for patent hemp-covered India-rubber cordage. Each filament was *inelasticated* by stretching in the process of winding, and, after being covered with silk or cotton, and woven or braided, had its elasticity restored by heat, in which process the semblance of raised figures was sometimes ingeniously given to the fabrics. More recently a machine has been constructed which makes 8,000 yards of thread from a pound of India-rubber, and another which divides it into four parts, making 32,000 yards of filament from a single pound of material. The process of Messrs. Aubert & Gerard, of Grenelle, in France, who have made many improvements, produces a perfectly cylindrical thread of any desired length and size,

In the manufacture of water-proof fabrics, shoes, and other articles in common use, very great improvements have been made, several of which have originated in this country. In April, 1831, George H. Richards, of Washington, District of Columbia, received a patent for a fluid caoutchouc to render articles water-proof. Soon after Edwin M. Chaffee, of Roxbury, Massachusetts, and others established the Roxbury India-rubber Company, which was chartered in 1833, and was the first organized in the United States to manufacture caoutchouc into water-proof clothing and other articles of common use. It manufactured shoes, coats, and hose, life-preservers, carriage traces and other articles of cloth, covering them with caoutchouc dissolved or suspended in one of the essential oils, of which spirits of turpentine was found the cheapest, although the solvent used was first kept a secret. Considerable excitement grew out of this effort, and shares in the company's stock, which originally sold at \$100, went up to \$300 and \$400. Active competition in the business soon sprang up, and during that year six companies were chartered in Massachusetts for manufacturing India-rubber goods, and were soon followed by others in New York and vicinity, in Troy, Providence, and elsewhere. In 1834 Mr. Chaffee took out letters patent for manufacturing India-rubber hose, and another for making boots and shoes of India-rubber leather, which was followed by one to the same in 1836 for applying India-rubber to cloths. About the same time Dr. Alexander Jones, of Mobile, Alabama, produced a very durable and handsome article of carpeting impervious to water or grease by means of an India-rubber varnish applied to canvas previously coated with wall-paper, the colors and patterns of which, showing through the varnish, and sometimes additionally ornamented with gold and silver leaf, gave it a rich and splendid appearance.

But the goods manufactured by the several processes as yet employed—both American and foreign—did not give satisfaction, and in some cases were of little value. They became hard and brittle in cold weather, and in warm weather adhered together, often in a worthless mass.

In September, 1835, the late Charles Goodyear, to whom the world is indebted for several of the most valuable improvements ever made in this department of manufactures, having already devoted several years to patient experiments, took out his first patent, which was for an India-rubber cement. In the following year his first great improvement was made at New York, when he succeeded in divesting

native caoutchouc of its adhesive properties by treating the surface with nitric acid. This enabled the manufacturer, for the first time, to expose an India-rubber surface on his goods. The process was patented in June, 1837, and was received with great favor, especially by the manufacturers of shoes, which continued to be made by that process extensively at Providence, Rhode Island, and elsewhere, until the superior method of vulcanization was introduced.

The first step in the latter discovery was made by Nathaniel Hayward, of Woburn, Massachusetts, who, about the year 1835, after repeated experiments, succeeded in removing the stickiness of caoutchouc by combining it with sulphur, which caused it to dry more completely than any other combination known. This process was patented in February, 1839, by Mr. Goodyear, as the assignee of Hayward. The sulphur, however, was found to impart to the goods the offensive odor of that mineral, and a tendency to become rigid in cold weather. By further experiments, made at Woburn with Hayward's sulphurizing process, Goodyear accidentally found that India-rubber combined with sulphur and certain salts of lead, when exposed to a high degree of heat, lost its sulphurous smell and its liability to be affected by changes of temperature. The new product, or vulcanized rubber, for which a patent was secured in June, 1844, reissued in 1849, extended in 1858, and again reissued in 1860, also possessed peculiar properties. It was more perfectly elastic than common caoutchouc, and resisted the action of the ordinary solvents of that substance. It also resisted the wear and tear of surface better, and being equally flexible in summer and winter, was admirably adapted to the manufacture of boots, shoes, harness, fire-hose, mail-bags, boats, &c. Mr. Nelson Goodyear's subsequent improvements, culminating in the production of the metallic or hard rubber, susceptible of polish, and capable of being moulded into any desired form, completed a series of discoveries among the most valuable in the present age. The inventor secured a patent for the vulcanizing process in France, in April, 1844, and during the same year in Great Britain and the United States. Upward of sixty patents obtained by Charles Goodyear for various improvements attest his fertility of invention. The great Council gold medal awarded him at the World's Fair in London in 1851, the grand medal of the World's Exhibition at Paris in 1855, and the ribbon of the legion of honor conferred by the Emperor of France, evinced the general appreciation of the value of his improvements in this branch of industry.

Improvements of the sulphurizing, vulcanizing, and other processes, including the use of steam, were also made in England and on the continent of Europe by Thomas Hancock, Parkes, Burk, Rattier & Guibal, Peroucel, and others, some of whose methods were little more than modifications of Goodyear's process.

In 1844 letters patent were issued to Charles Goodyear and to Horace H. Day, for improvements in the manufacture of corrugated or shirred India-rubber goods; and also, in that and the following year, to Mr. Day, in conjunction with Tyer and Helm, of New Brunswick, New Jersey, and to James Bogardus, of New York, for machines for cutting India-rubber threads for shirred goods, and another to Bogardus for an India-rubber shirring machine. By this shirring process, which was greatly facilitated by the use of these machines, a great variety of useful and elegant articles were made, among which was the elastic webbing so much used in the manufacture of Congress or gaiter boots. Shirred goods and suspenders were made in considerable quantities by several establishments at Newark and New Brunswick, New Jersey, under license from Goodyear. The protracted litigation which ensued between Messrs. Goodyear, Day, and their respective adherents, growing out of alleged infringements of their patents in processes and machinery, especially for the manufacture of shirred goods, is one of the most memorable in the annals of invention. It was for a time suspended by an arrangement between the parties in 1846, whereby Mr. Day agreed to relinquish the manufacture of all but elastic rubber goods, the exclusive right of making and selling which was guaranteed to him in virtue of his possessing superior machinery, by which alone such goods could be profitably made. Shirred goods, particularly elastic webbing for the gores of Congress boots, were thenceforward extensively manufactured at New Brunswick by Mr. Day and his associates. To these, in 1848, having repudiated his contract with Mr. Goodyear because of its alleged violation by the latter, Mr. Day added the production of India-rubber

goods in general, such as canes, combs, boxes, buckets, drinking-cups, and other hard-rubber articles; suspender ends of sheet-rubber, elastic rings, hose, coats, capes, and ponchos, steam-packing, leggings, caps, mittens, gloves, beds, water-beds, diving-dresses, air-cylinders, tents, life-preservers, shoes, and boats, on which last Mr. Day secured a patent. Having purchased the right for the United States of Mr. Fuller, the English patentee, Day afterward manufactured at his factory in Connecticut metallic India-rubber car springs, which had been previously made by Mr. F. M. Ray, at Harlem, New York, who claimed to be the original inventor in 1844, and as such secured a patent October 8, 1850. These goods were principally made of India-rubber and sulphur, and cured or vulcanized by steam, according to the improved process of Hancock, in England, the shirred goods being cured by dry heat.

The "Shoe Associates," as the manufacturers licensed by Goodyear were called after he abandoned to Day the manufacture of shirred goods, having, in disregard of the contract, commenced the manufacture of shirred goods, and certain parties having also procured from Goodyear the right to use his metallic rubber process, the patent for which was renewed in December, 1849, in the manufacture of "car springs," a renewal of the contest was begun between Mr. Day and the other manufacturers represented by Goodyear, which was protracted for several years at great expense. But all efforts were unable to do more than to embarrass the business of Mr. Day, whose extraordinary enterprise survived suits at one time pending against him in five or six States, and by as many as five and twenty different parties.

The manufacture of shirred suspenders, which at one time reached a million dollars a year, employing four or five factories, all using the process of Goodyear claimed by Hayward, and the machinery of Day and Tyer, and Helm, his foreman. The demand was afterward considerably diminished by the introduction of a superior article of woven suspenders largely manufactured in Connecticut and Massachusetts, and imported from France, and sold at a much lower price. About 1851 the Nashawannock Manufacturing Company commenced at Easthampton, Massachusetts, the manufacture of gum-elastic webbing, suspenders, &c., in which they employed a capital of \$100,000.

A leading branch of the India-rubber business in the United States is the manufacture of boots and overshoes.

The regular importation of India-rubber shoes from South America into the United States commenced in 1823, in which year 500 pairs were imported into Boston. In 1825 Thomas C. Wales, a merchant of that city, introduced the original Para overshoe in its rough state, as made by the Indians of Brazil, and soon after aided in bringing about an improvement in its shape by sending out American lasts to the native shoemakers. In 1848 nearly half a million rubber shoes were exported from Brazil to Europe and the United States. In addition to large quantities of the raw material sent out of the country in other and cheaper forms, nearly 300,000 pairs of shoes have been annually exported from Para for many years past.

Reference has already been made to the early attempts of Hummel, in this country, and of Fleetwood, in England, to manufacture water-proof shoes by the aid of India-rubber, and of the more successful enterprises of Chaffee, and the Roxbury, Providence, and other companies.

In 1832 Wait Webster, of New York, received a patent for attaching soles to gum-elastic boots and shoes. In the following year patents for similar objects were granted to Nathaniel Ruggles, of Bridgeport, Connecticut, and to Samuel D. Breed, of Philadelphia. During the latter year boots were exhibited at the fair of the American Institute, in New York, by J. M. Hood, of Wall street, which had been made in New York, sent to South America to be varnished with the fresh juice, and returned to be sold as India-rubber. Several establishments for the production of shoes and other fabrics came into existence about this time. In 1836 a new factory was erected in place of one recently destroyed by fire at Troy, New York, which made nearly 100 pairs of India-rubber shoes daily. In 1837 Stephen C. Smith, of New York, brought forward a process for making boots and shoes of sheet rubber by coating them with that material, and was granted a patent for it. About this time shoes of India-rubber, as they were then made, also apron cloth, caps, hats, life-preservers, and belting were made by

the Salem India-rubber Company, in Massachusetts, and probably elsewhere. But the first India-rubber overshoe, properly so called, it is claimed by Mr. Charles Goodyear, was about this time made by himself, assisted by his daughter, in a cellar in New York, where he was struggling with adversity in the enthusiastic prosecution of his future discoveries in this branch of industry. He obtained a patent for making shoes wholly of India-rubber. The "Goodyear patent shoe," made in large numbers at Providence, Rhode Island, and a few other places, shared the market with the "old-fashioned rubber" imported in improved form from Brazil. The latter was, however, rapidly superseding the former, to the great loss of the manufacturers, when the Goodyear metallic rubber shoe supplanted it, both by reason of its superior style and durability. This vulcanized or metallic rubber shoe was made, we believe, of sulphur, oxide of lead, or some salt of lead, camphene or other solvent, and India-rubber, ground together and cured in an oven. They were made in many places under licenses from Goodyear, who held the patent, although the process was claimed by Hayward, who opened a factory at Lisbon, Connecticut, where he made shoes stamped as "Hayward's Spring Tempered Rubber," and became one of the contestants of Goodyear's claims.

In 1850 the New Brunswick Rubber Company was established, to manufacture metallic boots and shoes under Goodyear's patent. For several years two of the largest India-rubber establishments in the United States produced annually between one and two million pairs of rubber boots and shoes under the same authority. The Hayward Rubber Company, at Colchester, Connecticut, was also established in the year last named, to use Hayward's solarized or carbonized rubber process. It was awarded a medal for shoes at the Great Exhibition in London in 1851, when Goodyear received the council medal for the extent, variety, and excellence of his goods, including India-rubber globes or spheres, patented by him in 1848. A medal was at the same time awarded S. C. Moulton for India-rubber goods. Among the numerous articles exhibited by Americans on that occasion may be mentioned vulcanized India-rubber carriage wheels, to run without noise, and pontoons of coarse India-rubber cloth.

Considerable improvement was made in the manufacture of shoes by the introduction of *gutta-percha* as a raw material. This curious substance, possessing several properties in common with caoutchouc, and materially differing from it in others, was first brought to the notice of Europeans by Dr. Montgomerie, resident at Singapore, in Asia, who, about the year 1842, sent to England a description of the tree and the uses made by the natives of its product. During the following year the first useful articles made of it, consisting of a lathe band, a short piece of tubing, &c., were presented to the Society of Arts in London, which the same year awarded the gold medal of the society to Dr. Montgomerie for calling attention to its valuable properties. During the next six years about 1,600 tons were imported into England from the islands of Borneo and Singapore, and the Malayan peninsula, by the London Gutta-percha Company, which owned all the early patents issued in England for its manufacture, in which they employed a capital of £300,000 sterling, deriving from the monopoly a large annual dividend. Its value as a material for surgical implements, such as catheters, syringes, &c., in which it has since been extensively employed, was early pointed out by Dr. Oxley, of Singapore.

In March, 1845, Richard Archibald Brooman, of London, recorded in England the first patents for various applications of gutta-percha by moulding, stamping, or embossing, and for making a thread of the same for the manufacture of piece goods. In May, 1848, he secured one or more letters patent in the United States. During the former year, within short intervals of one another, Charles Hancock, of Grosvenor Place, Charles Keene, of Sussex Place, Regent's Park, and Henry Bewley, of Dublin, each received patents in England; the first for making bands or belts of gutta-percha; the second for making boots, shoes, gaiters, and overalls of that material combined with caoutchouc; and the last for making flexible syringes, tubes, &c., of gutta-percha. Each of these also took out patents in the United States, bearing the same date as Brooman's.

In the United States gutta-percha was first used as a material for cement, for which it was found to be superior to caoutchouc. One of its earliest applications was for uniting the soles and other parts of boots and shoes. It was afterward adopted as a cement for cabinet and other wood work, and even

for broken stone, marble, and brick work. It came rapidly into use as a material in the useful and ornamental arts, and for scientific purposes, for all of which it is eminently fitted by reason of its great plasticity under heat, its pliability, toughness, and hardness at ordinary temperatures; by its imperviousness to water, and by its unalterability by means of oils and fatty acids, and by all ordinary chemical agents. These qualities have caused its adoption, either separate or combined, in the manufacture of an almost endless variety of nautical, surgical, chemical, electrical, agricultural, manufacturing, ornamental, and domestic appliances, some of which are met with in almost every household. Between 1845 and 1848 boots and shoes were largely manufactured in England of India-rubber combined with other materials, all of which, including those made under Keene's patent of caoutchouc and India-rubber, proved unserviceable, becoming, after a few months, a sticky mass. A process of dissolving and softening gutta-percha and caoutchouc in chloroform was patented in this country by Charles F. Durant in October, 1847, in which year it was first introduced here as a material for manufactures. In the following May Horace H. Day secured a patent for preparing gutta-percha fabrics in imitation of patent leather. During the same year (1848) the American Gutta-percha Company exhibited a variety of articles of this material at the fair of the American Institute, which awarded a gold medal to Mr. S. T. Armstrong, the company's director, to whom we are mainly indebted for the introduction of gutta-percha into the United States. Having, earlier in the year, contrived improved machinery for making gutta-percha tubing for insulating telegraph wires, Mr. Armstrong the same year submitted to Congress a proposition to lay a line of telegraph between America and some point on the English or Irish coast within twenty months, at a cost of three millions of dollars, using gutta-percha to insulate the wires. This use of the material, which is one of the most important, Mr. Armstrong claims to have originated, although his claims are disputed by Dr. J. J. Craven, of Newark, New Jersey, who, early in the same year, proposed such a wire, which was afterward laid across the Passaic and Hudson rivers between New York and Philadelphia. The first machinery for this purpose was put up in the autumn of 1848 at the works of the American Gutta-percha Company in Brooklyn, whence the design is believed to have been carried to England and used there a year after such cables had been used in this country. In August, 1848, the first wire thus prepared was laid across the Hudson river, at Fort Lee, by the Morse Telegraph Company. Up to this time chemists and manufacturers had unsuccessfully labored to impart to gutta-percha the elasticity and pliability of India-rubber. Various processes and materials were used for this purpose, among which may be mentioned those patented in England in 1847 by Charles Hancock and by Thomas Hancock, of Stoke Newington, and that patented in the United States by Stephen C. Moulton, which last consisted in mixing with gutta-percha hypersulphate of lead and calcined magnesia, and subjecting the whole to a temperature of 250° to 300° for several hours. After repeated experiments of a novel character, a process of vulcanization was at length successfully applied to gutta-percha by Wm. E. Rider and John Murphy, of New York, and patented in November, 1854. By this method, subsequently improved by Emory Rider, gutta-percha was rendered permanently flexible and elastic, like India-rubber, without liability to decompose, soften, or change by change of climate, or the action of acids or fatty substances, while it retained its natural lustre or polish. The article received at once a wide range of applications.

The North American Gutta-percha Company, in 1855, adopted gutta-percha exclusively as a cement, and was enabled to produce a quality of boots and shoes exceeding in lightness, pliability, and durability their highest expectations. Millions of boots and shoes are now annually made in Europe and America of India-rubber and gutta-percha, especially in the United States, where those materials employ several very large establishments.

In 1855 two factories at Providence, Rhode Island, made about 750,000 pairs of India-rubber shoes, valued at half a million dollars. Two others at New Haven, Connecticut, made about the same quantity annually.

A simple enumeration of the useful applications now made of these two substances would occupy pages.

The manufacture of gutta-percha goods was carried on in 1860 by two establishments in New York, whose united capital amounted to \$100,000; the cost of raw material consumed, to \$69,000; and the annual wages paid to 34 hands, \$21,600. The value of their product in manufactured goods was \$125,750.

The increase in the manufacture of caoutchouc and gutta-percha in Europe and America is further illustrated by the increased importations of the raw materials. The total export of caoutchouc from Brazil in 1828 was only 20,000 pounds weight, valued at 4,000 milreis. In 1845-6 it amounted to upwards of 8,000,000 pounds, in addition to 415,953 pairs of shoes, the whole valued at 500,000 milreis. The importations into France amounted—

From 1827 to 1837 to.....	44, 000 pounds.
1837 to 1847 to.....	180, 000 do.
1842 to 1852 to.....	266, 000 do.
1853 to 1854 to.....	1, 261, 000 do.
1855 to 1856 to.....	2, 139, 328 do.

The importations into Great Britain were inconsiderable previous to 1830, in which year they amounted to 52,000 pounds. During the year ending 5th of April, 1833, the quantity entered for consumption was 178,676 pounds. The price varied from 6*d.* to 2*s.* 6*d.* sterling per pound. The duty was afterward reduced from 5*d.* per pound to 1*s.* per cwt., and subsequently withdrawn altogether, which favored an increased consumption. In the year ending 5th of January, 1854, the importations amounted to 7,326 cwt., and from January 1, 1858, to 9,155 cwt. of caoutchouc.

The value of caoutchouc imported into and exported from the United States in the years 1856 and 1857 was as follows:

	For year ending January 30, 1856.	For year ending January 30, 1857.
Imports of manufactured caoutchouc .....	\$97, 796	\$180, 685
Imports of unmanufactured caoutchouc .....	1, 045, 576	832, 056
Total importations from foreign countries .....	<u>1, 143, 372</u>	<u>1, 012, 641</u>
Re-exported of foreign imports of manufactured caoutchouc .....	\$18, 379	\$62, 593
Re-exported of foreign imports of unmanufactured caoutchouc .....	120, 802	64, 492
Exports to foreign countries of domestic manufactures of caoutchouc in the same years:	139, 181	127, 085
Caoutchouc shoes, (685,220 pairs) .....	427, 936	331, 125 (537,328 pairs.)
Of other manufactures of caoutchouc .....	665, 602	312, 387
	<u>1, 232, 719</u>	<u>770, 597</u>

The importations of crude India-rubber in the fiscal year ending June 30, 1863, amounted to 2,125,561 pounds, valued at \$616,372, of which quantity 447,600 pounds, worth \$208,094, was re-exported.

Of domestic goods we exported in the year last named only to the value of \$143,856, in which were included 35,116 pairs of shoes, worth about as many dollars.

Of gutta-percha, the first shipment to Europe was made as an experiment, from Singapore, in 1840, to the amount of two hundred weight. In 1845 the exportation from that port amounted to 160 piculs, of 133½ pounds each; in 1846 to 5,364 piculs; in 1847 to 9,296; and in the first seven months of 1848 to 6,768 piculs; making a total in the first four and a half years of the trade of 21,598 piculs, valued at \$247,190. It all went to England except 15 piculs to the Mauritius, 470 to the continent of Europe, and 922 piculs to the United States. The price at Singapore was originally \$8 per picul. It afterward rose to \$23, but fell again to \$13 about the summer of 1848, in which year the importations into Eng-

land reached about 3,000,000 pounds. In 1852 the importations amounted to 30,580,480 pounds, a rate of increase which gave rise to serious apprehensions that the supply would, ere long, fall short of the demand, although many portions of the Indian continent and islands produced the trees from which it was obtained. The tree is one of slow growth, requiring from 80 to 120 years to reach maturity, and the first supplies were improvidently obtained by the natives by the total destruction of the tree. A method of tapping the trees has since been introduced, which prevents this wasteful sacrifice.

Under the tariff act of 1846 gutta-percha and India-rubber, in the unmanufactured state, paid a duty, the former of 20 and the latter of 10 per cent. ad valorem. In 1857 it was reduced on each to 4 per cent, and in 1861 both were admitted, as raw materials in the crude state, duty free, manufactures of India-rubber paying 20 per cent. In February, 1862, unmanufactured gutta-percha and India-rubber were charged with a duty of 10 per cent. ad valorem, and the latter in the milk double that rate, while its various manufactures were subject to a duty of 35 per cent.

Of crude gutta-percha, free of duty, the amount imported into the United States in the fiscal year ending June 30, 1862, was 333,260 pounds, valued at \$111,858.

#### WOMEN'S READY-MADE CLOTHING.

The manufacture of ladies' apparel has been greatly augmented within a few years. The increase of the trade has built up some very large establishments with heavy capitals. It has very much enlarged the area of female employment, and promoted the comfort and convenience of all classes. As in the production of men's clothing, the sewing machine has been a principal auxiliary in the extension of the business. The increased facilities for commercial intercourse between our large cities, where the manufacture is principally carried on, and the smaller towns and villages of the interior, has also given an impulse to the trade by enabling merchants and retailers everywhere to obtain and replenish at short intervals goods in every style and fashion suited to the market.

This branch of the clothing trade divides itself into the manufacture of cloaks and mantillas, of corsets and similar furnishing goods, of hoop skirts, and of millinery.

**CLOAKS AND MANTILLAS.**—This department of the ladies' clothing trade employed on the first of June, 1860, 96 establishments, producing annually over \$5,000,000 worth of goods. The capital employed by them amounted in the aggregate to \$473,400. They gave employment to 1,532 female and 46 male hands, whose annual wages cost \$301,428, the cost of raw material amounting to \$1,178,875. The aggregate value of cloaks and mantillas made was \$2,261,546, an average product of \$23,557 to each establishment, and of \$1,433 to each hand employed.

Of these establishments the New England States contained 24, the middle States 58, the western 6, and the southern 8.

The returns from New England were received for 14 establishments in Massachusetts, 6 in Connecticut, and 2 each in Maine and New Hampshire. The total capital employed in them was \$115,900, the number of hands 421 females and 17 males, who received annually in wages \$83,484, and produced goods to the value of \$698,361, an average of \$29,098 for each establishment, and \$1,594 per hand. The 14 establishments in Massachusetts aggregated a capital of \$90,800, and consumed raw materials worth \$235,375, producing, with the labor of 285 women and 12 men, costing annually \$57,324 in wages, a product amounting to \$475,460, or upward of one-fifth the whole value made in the Union. The average product of each factory was \$33,961, and of each hand \$1,600 per annum. New Hampshire had two establishments, with 102 female hands, who received in wages \$18,360 per annum. The product amounted to \$201,826, an average of more than \$100,000 each, and of \$1,978 to each operative.

The capital invested in the middle States was \$320,750, and the number of persons employed was 975 females and 27 males, who received in wages \$189,360 annually. The value of the manufacture in that section was \$1,376,955, in the proportion of \$23,557 to each establishment, and \$1,374 to each person employed. The returns were from 22 establishments in New York, 32 in Pennsylvania, and 4 in Maryland. The New York manufacturers had invested a capital of \$91,000 and 453 persons, of whom 19 were male hands. Their wages cost \$99,732 per annum, and the cost of material was \$401,920. The product was \$685,600, or nearly equal to that of all New England, and averaged \$31,163 to each factory, and \$1,513 to each hand. The 32 establishments in Pennsylvania had, collectively, a capital of \$217,550; paid yearly for raw materials \$306,055, and for the wages of 500 women and 7 men \$83,892. The value of the manufacture in that State was \$662,930, equal to \$20,716 for each establishment, and \$1,307 for each hand.

In Maryland 4 firms, with 42 hands, made cloaks and mantillas to the value of \$28,425. Two establishments in Ohio made returns of \$27,000 invested as capital, and of 80 women employed in this business, which yielded a product valued at \$74,000. In Wisconsin there were 4 concerns, having \$8,000 invested, and giving employment to 31 hands, the product of whose labor was \$67,400, making the total value of cloaks and mantillas returned from the western establishments \$141,400, an average of \$23,566 each, and of \$1,273 to each hand employed.

From the southern States returns were made by two small establishments in Virginia and six in Tennessee, the former employing nine hands and making goods to the value of \$8,330, and the latter, with 18 hands, producing \$36,500 per annum. The product was an average of only \$5,966 to each establishment, and of \$1,660 to each hand employed in that section. In Tennessee the value above given was in part of ladies' dresses made in the State.

This branch of the domestic clothing trade, which thus employs nearly half a million dollars in capital, and with the labor of less than 1,600 hands produced upward of two and a quarter million dollars worth of cloaks and mantillas annually, is one of quite recent growth, and has received its principal development within the ten or fifteen years preceding the last census. The manufacture has its principal seat in the city of New York, which has 15 large establishments, one of which employs 100 girls, and makes goods to the value of \$120,000 per annum. Two others employ 70 and 40 hands, respectively, and make each about \$100,000 worth. The whole value of cloaks and mantillas made in that city in 1860 was \$618,400. A large manufacturer in that city who commenced business in 1849 was the first to introduce sewing machines in the business, as well as the first to employ young women in the retail sales department. The largest establishment in Boston also employs 100 females, and makes \$150,000 worth of ladies' cloaks and mantillas annually, while two others in that city employ each about 75 hands, and manufacture to the value of \$125,000 each. All but \$13,000 of the product in Massachusetts was made by ten factories in Boston.

Of the total value of these goods made in Pennsylvania, only \$6,130 was produced outside of Philadelphia, in which the largest manufacturer makes about \$150,000 worth yearly, another \$75,000 worth, and two others to the value of about \$60,000 each.

In Maryland, Ohio, and Wisconsin, in like manner, the business is exclusively carried on at Baltimore, Cincinnati, and Milwaukee.

Sewing machines are now extensively employed in this manufacture, particularly in New York, where the operatives have heretofore been paid about \$6 per week, hand-sewers receiving about \$4. The average annual wages paid to the employés in this branch of trade, according to the census returns, was, in Boston, \$193; in New York, \$220; in Philadelphia, \$165; in Baltimore, \$136; in Cincinnati, \$202; in Milwaukee, \$209. The manufacturers of talmas, cloaks, and mantillas are generally retail dealers in dress goods, and sell imported as well as domestic goods.

**CORSETS.**—The returns of this manufacture were from 14 establishments in the four States of New York, Pennsylvania, Maryland, and Louisiana, and, like the last, were confined to their principal cities. The amount of capital employed in it was \$24,400; the cost of raw materials, \$19,130; the number of hands 96, of whom 6 were males; and their annual wages was \$13,644. The value of the manufactured goods was \$54,460, of which value \$19,000 was produced by 4 establishments in New York, and \$22,600 by 8 manufactories in Philadelphia. One establishment in Baltimore produced corsets to the value of \$9,360, and one in New Orleans \$3,500 worth. The manufacture of corsets has been recently commenced at Meriden, Connecticut, and corset braces are made at Middletown, in that State. A loom has recently been patented for weaving irregular goods, such as corsets, in which gores are required. There is no reason why we should not be wholly independent of importations for this article of ladies' wear.

**HOOP-SKIRTS.**—This branch of the ladies' furnishing trade was very greatly extended in the ten years preceding the last census. Like the cloak and mantilla manufacture it is one of recent growth, and in 1860 employed 78 establishments, having an aggregate capital of \$923,850, and which paid annually for raw materials \$2,125,330, and for wages \$877,960, the number of hands employed being 837 men and 3,228 women. The value of the annual manufacture was \$4,865,033. The average capital of each establishment was \$11,844, its number of hands 52, whose annual wages averaged \$201 each, and the value of the product of each factory was \$62,372.

The New England States of New Hampshire, Massachusetts, Rhode Island, and Connecticut, numbered 33 hoop-skirt factories, having a capital of \$547,100, and employing 1,264 female and 562 male hands, at an annual cost for labor of \$436,232. The product of these States was valued at \$2,303,341. Connecticut was the leading producer of this article, having 15 establishments, with a collective capital of \$424,100, and 426 male and 1,038 female hands, whose wages amounted to \$358,332 per annum. The value of the goods made in that State was \$1,693,600, or more than one-third of the total product of all the States. Several of these factories were at Meriden, Connecticut, where a single establishment, which commenced in 1855, sold, in less than one year after, hoop-skirts to the value of \$300,000, and makes about 400 dozen daily, in addition to making its own tape and corsets, and Balmoral skirts, the manufacture of which has been recently added, and, together, employ from 700 to 800 work-people. Another factory in the place employed 80 women and 10 men in the manufacture of hoop-skirts, which are also made at Birmingham and other places. A factory at Bridgeport makes nearly \$50,000 worth of hoop-skirt springs, which are also made at Middletown.

Massachusetts contained 10 hoop-skirt factories, with a capital amounting, in the aggregate, to \$117,600, and an annual product of \$588,800, in the production of which 128 male and 206 female hands were employed. There were 2 factories in New Hampshire and 6 in Rhode Island.

This manufacture was carried on in all the five middle States, in which the establishments numbered 44, the total capital \$376,400, the cost of material \$986,490, and of labor \$439,328. The number of hands was 275 males and 1,949 females, and the product of their labor was valued at \$2,557,022, or upward of 52 per cent. of the whole. This was principally the product of factories in New York, which

## INTRODUCTION.

LXXXV

numbered 34, and had a combined capital of \$320,500. They paid for raw materials \$854,907, and for the labor of 233 men and 1,697 women, \$400,592 per annum. The value of hoop-skirts made in these was \$2,238,617, which was nearly equal to that of all New England, and amounted to 46 per cent. of the total product of this industry throughout the Union. It was all produced in the city of New York, except about \$167,000, the value made in Brooklyn and Williamsburg.

Four establishments in Pennsylvania manufactured to the value of \$14,930, and three in New Jersey, with 255 hands, produced \$288,100 worth of hoop-skirts, being, next to those of Connecticut, relatively the largest, in their average capital and product, of any in the country.

One establishment in Virginia, employing 15 women, made hoop-skirts to the value of \$4,670.

Sewing machines are very extensively used in the manufacture of hoop-skirts. A single firm in New York has employed as many as 150 machines, at a cost of \$15,000, each of which was calculated to do the work of ten hand-sewers. The whole number of hands employed was 300, and the materials used weekly were 275 pieces of muslin, 2,000 pounds of jute cord, 600 dozens of spool cotton, and \$6,000 worth of whalebone, made flexible by being boiled in oil. Twenty-five looms in the city were also kept employed in making hair-cloth for the inflation of ladies' garments, and producing 3,000 yards weekly, besides 100 looms on other fabrics, and the product was about 3,000 skirts per diem, exclusive of woven goods. Many improvements have since been made in the manufacture of this article, and steel and brass hoops have almost entirely superseded whalebone and rattan.

*Statistics of ladies' clothing produced in the United States during the year ending June 1, 1860.*

**MILLINERY.**—This is a very ancient and important branch of the ladies' clothing trade, and, like dress-making, with which it is sometimes combined, employs, in every country, a more mixed class of the community than any other calling. Among these are to be found the wives and daughters of clergymen, military and naval officers, surgeons and physicians, farmers, and tradesmen of every description. In all large cities this class is numerous, and in the city of London, in 1840, the milliners and dress-makers, together, numbered 20,780, of whom 3,480 were females under twenty years of age, and 117 were males.

Milliners' work includes the making and trimming of bonnets, caps, scarfs, and all outward attire worn by females except the gown. It is supposed to demand a higher exercise of skill and taste than that of dress-making.

In the United States there were, on the 1st of June, 1860, 940 establishments, producing milliners' work, severally, to the value of \$500 and upwards. Their aggregate capital was \$1,379,777, and the number of persons employed by them 4,746, of whom 132 were males. The annual cost of raw materials used amounted to \$2,156,192, and of labor, to \$887,702. The value of the manufactured articles was \$4,543,284. Each establishment, on an average, employed a capital of \$1,467, and 5 hands, at an average yearly compensation of \$187 to each hand. The annual product of each shop averaged \$4,833.

The eastern States contained milliners' establishments, which reported a total capital of \$214,650, and an expenditure for raw materials of \$366,636, the cost of labor for 34 males and 778 females being \$150,540. The aggregate value of the work done was \$765,998, an average of \$5,246 each. The average investment of each establishment was \$1,470, and each hand received annually in wages an average of \$185. In Massachusetts there were 40 establishments, which employed 398 hands, (25 of them males,) or nearly ten each, at an average salary of \$197 each. They produced milliners' work to the value of \$8,884 each. Eighteen of the largest of these shops were in Boston, and employed 167 hands, producing \$238,450, the medium product of each being upward of \$13,000 annually.

In Rhode Island and Connecticut there were 28 establishments each, and in New Hampshire 19, and the value of millinery made in each State exceeded \$100,000.

In Maine there were 24 shops, making over \$70,000 worth annually, and in Vermont 7, whose product was \$31,750.

The middle States and District of Columbia reported 601 establishments, aggregating a capital of \$852,510, 2,926 hands, including 77 male hands, and a product in millinery work valued at \$2,692,338. The annual cost to these shops for raw materials amounted to \$1,301,651, and for labor \$530,766. Their average capital was \$1,418, the number of hands nearly 5, and the average wages of each hand \$181 per annum, the medium product of each being \$4,479.

In the State of New York there were 248 millinery establishments, chiefly in the cities of New York and Brooklyn. They represented a capital of \$492,520, and gave employment to 1,501 hands, of whom 51 were males, whose aggregate labor cost \$298,134, the cost of materials being \$867,209, and the value of the work done \$1,733,688, an average of \$6,990 each. The average capital was \$1,986 to each shop, and the wages of each hand about \$198.

From Pennsylvania returns were made by 281 millinery shops, whose capital was \$293,215, and the product \$761,881, the number of hands being 1,171, at an average annual salary, including that of 24 males, of \$165 each.

In the western States these establishments numbered 170. Their collective capital was \$223,820, or an average of \$1,316 each, and they employed 21 male and 812 female hands, at a total cost for wages of \$156,500, or about \$187 for each hand. The annual cost of raw material amounted to \$346,337, and the total annual value of millinery made was \$770,169, or upward of one-sixth of the whole product of the Union, and in the proportion of \$4,530 to each establishment. Ohio was the largest producer, having 59 millinery establishments, which employed 366 persons, and made annually \$281,546 worth of millinery, of which value more than two-thirds was the product of about thirty shops in Cincinnati. Illinois was next to Ohio in the value of millinery made, having 27 shops, with 130 hands, whose work was valued at \$178,810, the greater part of it made by 12 establishments in Chicago. Missouri ranked next, 11 establishments having made millinery worth \$90,523; all but about \$2,000 of which was produced by 9 shops in St. Louis. In Indiana, Wisconsin, and Kentucky, the value of milliners' work exceeded \$56,000 each, and in Michigan it was nearly \$34,000.

From five of the southern States reports were made of 22 millinery establishments, having a total capital of \$87,797, and 173 female hands employed, at an average annual compensation of \$284 each. The value of the millinery made was \$309,779, an average product of \$14,080 by each establishment, of which the average capital was \$3,990. The cost of material was \$137,568, and of wages \$49,176. The largest establishments were in Louisiana and in the city of New Orleans, three shops in that State having, with 99 females employed, at a cost of \$32,556 per annum, made millinery to the value of \$188,425, although their capital amounted to only \$16,400. Four establishments in Georgia, with double the capital above named, employed only 19 hands, and produced work valued at \$55,904. In Virginia 11 milliners' establishments, with \$22,647 in capital, and 42 hands, to whom were paid for labor \$6,876, reported a product of \$52,450. The average cost of wages in Virginia was \$284, in Georgia \$374, and in Louisiana nearly \$329 annually to each hand.

California contained one establishment for millinery, with a capital of \$1,000, and 2 hands, which produced work to the value of \$5,000, the cost of material being \$4,000, and of labor \$720.

## INTRODUCTION.

*Statistics of millinery produced in the United States during the year ending June 1, 1860.*

**MILLINERY GOODS.**—This branch embraces the manufacture of such articles as ruches for bonnet borders, joined blonds, and other trimmings, and bonnet frames, and also that of artificial flowers, the last being the largest item in the business.

The production of all kinds of millinery goods employed 35 establishments in the United States in 1860. Their total capital was \$365,900, and they employed 111 male and 923 female hands, at an annual cost of \$202,508. The cost of raw materials for the manufacture was \$739,965, and the value of the goods made was \$1,483,154.

## INTRODUCTION.

LXXXIX

*Statistics of millinery goods produced in the year ending June 1, 1860.*

**ARTIFICIAL FLOWERS.**—The manufacture of these beautiful ornaments for the head-dresses of females is believed to have been first produced with any degree of perfection by the Italians. For many years past, however, the French have been unrivalled, particularly in the permanency and delicacy of the tints imparted to their flowers, and both the climate and the waters of the Seine have been supposed to contribute to this end by fixing the dyes. The materials used were originally silk, and in South America feathers were employed with much effect by the natives, but the latter are not easily dyed. Velvet, thin shavings of whalebone, and the finest cambric are now used in France for the petals, taffeta for the leaves, and whalebone or wire covered with silk for the stems. The leaves and petals, having been cut with a metal stamp or with the scissors, are glued together with a solution of gum-arabic, and the colors are put on with a fine hair pencil, as drawings are colored and shaded. Carmine is used for red and pink colors, a tincture of turmeric for the yellow, verdigris for the green, indigo for the blue, and a tincture of logwood with oxide of tin for the purple colors. Much taste and skill are required in grouping the separate flowers and in tying them together in a natural manner.

This manufacture in the United States in 1860 employed 21 establishments, of which 16 were in New York, 4 in Pennsylvania, and 1 in Louisiana. Their total capital was \$274,200, and they paid for the materials worked up \$515,117, and for labor \$111,464. The number of hands engaged in the business was 600, of whom 52 were males, and they made artificial flowers to the value of \$1,053,600. With the exception of one small establishment in New Orleans, which made \$2,600 worth, these establishments were all in the cities of New York and Philadelphia. In the former city were some very large establishments, and the business there employs a capital of \$237,200, and 390 female and 35 male hands. The materials cost annually \$505,317, and the wages of labor \$84,284. The value of the manufacture amounted to \$984,500, an average of \$61,531 to each establishment. The average annual wages of the hands was \$196 each. In Philadelphia four manufacturers of artificial flowers had invested a capital of \$36,500, and employed 16 male and 156 female hands, at an annual cost for wages of \$26,220, or an average of \$152 each. The cost of materials was only \$8,800, or less than one-third the cost of labor, while in New York the materials used cost about six times as much as the labor. The product in Philadelphia was \$66,500. The artificial flowers made in these establishments are not generally equal to the French. One enterprising firm in New York brought over from France several hundred flower-makers and established a large manufactory. As the labor and materials were entirely French, and the quality of the flowers made were equal to the imported, it was no misnomer to call the product "French flowers," though made in America. One establishment in that city made flowers to the value of \$300,000 in a year. Included in the returns of another large establishment in that city

were bonnet frames and other "millinery goods," which, if separated, would lessen the aggregate value of flowers made and increase that of—

**MISCELLANEOUS MILLINERY GOODS.**—These, in the States of Massachusetts, New York, and Pennsylvania, employed 14 establishments, and a capital of \$91,700. The expenditure for material was \$224,848, and for labor \$91,044. The latter sum was the annual wages of 59 men and 375 women and girls, the product of whose labor amounted to \$429,554.

Of these articles, as of artificial flowers, the city of New York was the principal producer, having 9 factories, with 44 male and 265 female hands, who made ruches, bonnet-frames, &c., to the value of \$238,154. The capital invested by them was \$31,500, and they paid annually for materials \$104,796, and for labor \$60,300.

The largest establishment, however, in this country was in Philadelphia, and employed 70 females, making \$140,000 worth in 1860, when the price of such goods was very low. This was a decline from its former business, when it employed 200 hands in making ruches alone, aided by machinery that enabled one man to goffer six or seven hundred dozens in a day, and the establishment to turn out daily 1,000 dozen of finished ruches, besides other millinery. This was the first to make an almost exclusive business of ruches. Three manufactories of milliners' goods in Philadelphia had a total capital of \$57,500, and employed 110 hands, whose labor cost \$28,344. They used materials to the value of \$117,096, and produced goods valued at \$181,000. Bonnet-frames, bonnet-wire, silk bonnets, &c., were made by several firms in Philadelphia. Two establishments in Massachusetts employed 15 persons, and made millinery goods to the value of \$10,400 in 1860.

The total value of artificial flowers and feathers imported in the year ending June 30, 1860, was \$776,743, chiefly from England and France. In 1862 the value of the same articles imported in a finished state was \$253,134, at a duty, after April 1 of that year, of 30 per cent., which was the next year raised to 40 per cent. The imports of millinery and millinery goods cannot be exactly stated. Millinery of all kinds, by the act of February, 1862, was charged with a duty of 25 per cent.; but on June 30, 1864, the duty on ready-made silk clothing was 60 per cent.

#### STRAW GOODS.

This manufacture not only supplies a large amount of milliners' stock, such as women's and children's bonnets, hats, braid, and trimmings of straw, but includes also the production of men's and boys' hats to a large amount.

The business in 1860 employed 40 establishments in the United States, and a total capital of \$1,276,700. It gave employment to 826 male and 6,863 female hands, whose labor cost annually \$1,407,092, and who wrought up materials to the value of \$2,589,416, producing straw goods to the value of \$4,499,616. This includes, however, the value of some hats and bonnets imported or bought in the rough state and finished according to the prevailing style, which employs one very large and one or more smaller establishments in Connecticut.

The manufacture of straw hats and bonnets is principally carried on in Massachusetts, where it was commenced in the beginning of this century. It employs in that State 26 establishments, having a capital of \$925,200, and employing, at an annual cost of \$1,096,164, the labor of 617 male and 5,601 female hands, nearly 200 pressing machines, and a considerable number of sewing machines. The cost of domestic and foreign braids and other materials cost \$1,895,616, and the product amounted in value to \$3,398,466. It included the value of about 2,238,320 bonnets, and 2,071,000 hats, and 4,845 dozens of buttons, cords, and garlands, valued at one dollar per dozen. The principal seat of the manufacture was in Norfolk county, which returned a manufacture of upward of 1,250,000 bonnets, and over 1,500,000 hats, together valued at more than \$2,000,000. The largest establishment is at Foxboro, which village, with the country around, is almost supported by it. In 1860 the average number of hands employed was 225 males and 2,020 females; but the whole number of girls who worked at the factory and at their own homes was fully 5,000. The wages paid was upward of \$271,000, and, with a capital of \$500,000, they turned out 1,800,000 bonnets and hats, to the value of \$1,200,000. In the same county there were five others, making over 100,000 hats and bonnets each.

One of four establishments in Worcester county made straw goods to the value of \$375,000, and another in Plymouth \$180,000. In Hampden county one manufactory, with 28 male hands and 500 females, made bonnets to the value of \$300,000; and another in Bristol county, with 40 male and 500 female hands, made \$225,000 worth of bonnets and hats. The finer braids or plaits used in the manufacture of bonnets and hats are imported from Italy, Switzerland, China, and Great Britain, and some coarse straw for men's hats from Canada. The number of factories employed on straw goods in Connecticut was 7, with an aggregate capital of \$269,700. They employed 160 male and 1,013 female hands, whose labor cost \$257,400. The cost of materials was \$581,500, and the value of the product \$896,350.

There was 1 factory at Buffalo, New York, with a capital of \$15,000, which employed 21 persons, and made straw goods to the value of \$12,000 annually, and included with hats are straw goods valued at \$18,500, made in New York city. The principal part of the New England straw goods are sold in that city. An establishment at Newark, New Jersey, having invested \$20,000, and employing 25 males and 60 females, manufactured hats, chiefly, to the value of \$104,000. Five small establishments in Pennsylvania reported a capital of \$46,800, and a force of 23 male and 169 female hands, making straw goods to the value of \$88,800, which was less than its value in previous years.

PALM-LEAF HATS were made in 30 establishments, of which 23 were in Massachusetts. Their manufacture employed a total capital of \$80,600, and the labor of 186 male and 690 female hands. The cost of labor amounted to \$169,068, and the cost of raw materials was \$351,188 per annum. The value of the manufactured goods was \$760,287. Of this sum \$606,687 was the value made in Massachusetts by 129 males and 565 females employed, at a cost of \$123,828, and working up \$73,700 worth of imported materials annually. Twenty-one of these establishments were in Worcester county, one of which made hats to the value of \$100,000. The largest concern was in Hampshire county, and, with 15 male and 60 female hands, made palm-leaf hats to the value of \$66,000, and hoods, or Shaker bonnets, worth \$68,000, a total product of \$134,000. In 1855 the official returns of these goods made in that county was of the value of \$184,189, and the total value made in the State was \$293,208. The manufacture was widely distributed throughout the county, but was principally carried on at Barre, Fitchburg, Athol, Petersham, Royalston, Dana, Sterling, Princeton, Hardwick, &c. In Hampshire, the next largest producer, palm-leaf hats were made at Enfield, Greenwich, Pelham, Plainfield, Cummington, Hadley, Ware, and other towns; nearly all the females in some places, as Greenwich, being employed in the business, which was often carried on as a household industry.

From New Hampshire, in 1860, reports were made by 7 establishments for making palm-leaf hats. These gave employment to 57 male hands and 125 females, whose annual wages were \$45,240, and whose labor produced a value of \$153,600.

In the year ending June 30, 1860, palm-leaf hats of domestic manufacture were exported chiefly from New York, Boston, and San Francisco, to the value of \$92,832. They went principally to Cuba and South America, England, and the British provinces, and West India islands. The amount was nearly equal to the value of unmanufactured palm leaf imported, chiefly from Cuba and Tuscany. In 1862 the imports of crude palm leaf was only \$25,865, duty free.

#### HISTORY AND STATISTICS.

Of these two branches—straw and palm-leaf goods, which together amounted to upwards of \$5,250,000 in value annually—the former is much the older and more important industry in the United States, and is altogether the growth of the present century. As early as July, 1717, one Thomas Masters, of Philadelphia, petitioned Governor Keith, and was allowed to record in the province two patents granted him by the King, one of which was for weaving palmetto, chip, and straw hats by a new method which he had invented at great expense. Hats made of palmetto are still earlier mentioned in a history of Carolina, where their use afterward became quite common in consequence of the negroes, when newly imported from Africa, of their own accord, taking themselves to the manufacture of hats from the inner lamina of the bark.

Although the plaiting of round straw hats and bonnets has been carried on for nearly 200 years at Dunstable, and still longer in Italy, it appears to be tolerably well authenticated that the straw bonnet manufacture in the United States, and particularly the manufacture of split straw goods, was an original invention on the part of Mrs. Baker, still living six years ago at Dedham, Massachusetts. In 1798 Miss Betsy Metcalf, at the age of twelve years, having seen a Dunstable bonnet in a store, set to work without instruction or any opportunity of unbraiding a plait, and by perseverance succeeded in making for herself a bonnet of oat straw, which she cut and smoothed with the scissors and split with her thumb-nail, and bleached in the vapor of sulphur. An exact fac simile of her first bonnet, which was one of seven braid, with bottom inserted like open-work, and lined with pink satin, was made by Mrs. Baker a few years since and deposited in the collection of the Rhode Island Society for the Encouragement of Domestic Industry. Having, in subsequent years, gratuitously imparted a knowledge of the art to the young women of Dedham, Wrentham, Providence, and other towns, the business has gradually extended throughout that and neighboring States until it has reached its present magnitude. In early times the straw was generally split and flattened by a hot iron and then pasted upon cloth or paper. The plait thus formed was cut into patterns and made up and trimmed according to the prevailing mode.

The introduction into New England of a more durable style of straw plait made of unsplit straw, in closer imitation of the Scotch, has been attributed to a young merchant of Taunton, who, during a short residence in a southern State, made the acquaintance of two English females who made up and sold bonnets of the celebrated Dunstable braid. Having observed that females were carefully excluded from their workshop, he noted all the processes from the straw to the finished article, and carried home the details to the straw workers of his own county. Other improvements were subsequently made, particularly in the art of bleaching, and by the introduction of machinery for cutting and smoothing the straw, shaping and pressing the bonnets, &c. In 1801 the business was commenced at Wrentham, which was long a principal seat of the manufacture, and in 1810 made about \$100,000 worth, which was supposed to be nearly one-half the product of the county, exclusive of the value of hats and bonnets worn by those who made them.

The national census of that year reported straw bonnets to the value of \$551,988 made in seven counties of Massachusetts, of which Norfolk county produced \$217,424; Middlesex, \$93,794; Bristol, \$90,671; Worcester, \$77,780; and Hampshire, \$63,750; the balance being made in Plymouth and Essex. In Rhode Island 9,260 bonnets were made, valued at \$25,800, and in Connecticut a value of \$27,100 was reported. A few were also made in Vermont and New Jersey. The total value of straw bonnets was \$606,058. Nearly half the value of bonnets made in Massachusetts was exported to New York, Philadelphia, Charleston, New Orleans, and other southern cities, and to the West Indies. In a few years the processes of cutting, smoothing, bleaching, and braiding, and the sewing and trimming of straw bonnets, became separate branches of trade. Rye straw was principally used as a domestic material, and when cut in the green state yielded the farmer nearly double the profit that the ripened grain would.

Under the tariff of duties established in April, 1816, straw bonnets and hats with artificial flowers and millinery paid an ad valorem duty of 30 per cent. on a minimum valuation at the place of packing. In consequence of the heavy importations of bonnets and hats manufactured by the cheap labor of Italy, which came into fashion about 1820, the domestic manufacture of straw goods was checked, and many females turned their attention to imitating the Leghorn bonnet. A Miss Woodhouse, of Weathersfield, Connecticut, in April, 1821, sent to London a bonnet, accompanied by samples of the raw and bleached materials, made of the culm of the indigenous spear, wire, or meadow grass, a species of *poa*, and which was laid before the Society for the Encouragement of Arts and Manufactures in that city. The bonnet was admitted by dealers in London to be equal to the best Leghorn in fineness and color; and the society awarded Miss Woodhouse its large silver medal and twenty guineas. Miss Lucy Burnap, of Merrimack, New Hampshire, about the same time, made a bonnet in imitation of Leghorn, which sold at auction for \$50 in New York, where premiums as high as \$20 were offered for the best specimens of straw

bonnets. Miss Burnap, in February, 1823, took out letters patent for weaving straw and grass for hats and bonnets. Many samples of bonnets made in different places from New England wire grass or straw sold at this time for \$30 to \$50 each, which cost the females who made them two or three months' labor. In the year last mentioned it was computed that 300,000 straw bonnets were made in Massachusetts, and valued at \$875,000, affording, however, but little profit, although much of the braiding was done by children in families, at a small cost for wages.

In 1824 the duty on foreign hats and bonnets of straw, chip, or grass, including Leghorn hats and bonnets, and on all flats, braid, or plaits for making them, was raised to 50 per cent. ad valorem, but in 1832 was again reduced to 30 per cent.

A straw plaiting school was established in Baltimore in 1824 to instruct poor girls in the various branches of the bonnet manufacture.

About 1830 many rye straw bonnets were made at Boxford, Massachusetts, which sold in New York as imported articles for \$10 to \$15 each, which cost but two or three to make. In 1834 the town of Franklin made straw hats and bonnets to the value of \$80,000, and in 1855 it had 6 shops, which made 579,160, valued at \$405,000, besides \$2,000 worth of straw braid not made into bonnets. A silk establishment in Boston employed, in 1835, from 150 to 200 looms in weaving Tuscan braid in a great variety of elegant patterns. The warp consisted of domestic silk manufactured on the spot, and the filling was chiefly Tuscan straw, imported at a cost of one dollar or upward per pound. Manilla grass was occasionally mixed, its whiter color and shining appearance producing an agreeable effect. Fine thin strips of whalebone were also occasionally mixed in with similar effect. From 800 to 1,200 bonnets per week, of a great variety of forms and patterns, were made and sold by wholesale at \$2 50 to \$14 each, and children's hats at \$2. At Hartford, Connecticut, a similar establishment employed upward of 100 looms in weaving Tuscan braid.

The total value of straw bonnets and hats made in the United States, as returned by the census of 1840, was \$1,476,500, the value reported from Massachusetts being \$821,646, and from Connecticut \$236,730. The value made in New York was \$160,248, and in Pennsylvania \$80,512. A greater or less value was made in twenty States. In consequence of large importations of Leghorn, Panama, and Manilla hats under the reduced tariff, the manufacture was declining in 1842, when the duty was raised once more to 35 per cent., to be again reduced in 1846 to 30 and in 1857 to 24 per cent. It has since been raised to 40 per cent. or upward.

In 1845 Massachusetts turned out 1,046,954 straw bonnets and hats, valued at about as many dollars, and of straw braid to the value of \$102,237, besides palm-leaf hats. In 1855, according to the State census, 42 establishments in Massachusetts, in addition to palm-leaf goods, made 3,326,030 straw bonnets, and 1,907,485 straw hats, and straw braid worth \$94,137. The total value of these articles and of palm-leaf hats was estimated at \$4,905,553, and the number of hands employed at 14,511. Boston is the principal market for these goods, and had before the war a large trade in straw and palm-leaf hats and bonnets with the south, where the demand was large and constant.

The greater part of the domestic straw plait or braid manufactured is produced in New England by children from 6 to 12 years of age, of home-grown or foreign materials. These are split straw, the narrow and fine qualities being nearly equal to the English, a wide straw of inferior quality, called Devon, and imitations of English "patent" and whole straw. But the principal part of the materials, as already observed, are imported from Europe and China, with some coarse straw for men's hats from Canada. The Canton straw or braid is largely made up for the southern markets, and much of it is sewed in New York, and thence shipped coastwise or distributed by land to other cities.

We import these goods to a large amount annually, but there is no reason why the country should not be independent of foreign producers in straw goods, if not in the raw material.

*Palm-leaf* hats began to be made in Massachusetts in 1826, and five years after the number made in that State was about two millions. Nearly one-half of these were made in Worcester county, which has been the principal seat of their manufacture ever since. The materials were imported free of duty from Cuba, and made up chiefly by little girls from four years old and upward. In 1845 the number

made in Massachusetts was 2,845,264, and their value \$489,237. This and the straw manufacture at that time employed three cotton mills in New England exclusively in the manufacture of thread for sewing them. In 1855 the product of palm-leaf hats in that State had fallen off to a value of \$293,208. Several of the Shaker communities manufacture bonnets and hoods of this material.

The value of hats and bonnets of Leghorn, straw, chip, grass and other vegetable materials imported into the United States in the fiscal year ending with June, 1860, was \$1,603,239. These were entered chiefly at New York, and came principally from Tuscany and other Italian states, England, and France, and some from Bremen, South America, and China. The value of these foreign articles exported in that year was \$99,434, leaving one and a half million for consumption. In 1862 the value of hats and bonnets imported was only \$143,963, and of straw goods, laces, braids, and ornaments of vegetable substances \$80,523. The value of these exported was \$39,786.

The value of unmanufactured palm leaf imported in 1860 was \$99,557. In 1862 the value of crude palm leaf imported duty free was \$25,865, chiefly from Cuba and Tuscany.

The value of palm-leaf hats of domestic manufacture exported in 1860 was \$92,832, chiefly from New York, Boston, and San Francisco. They were shipped to Cuba and South America, England, and the British Provinces, and West India islands.

In 1862 the value of straw and palm-leaf hats exported was \$55,446.

*Statistics of straw goods produced in the United States during the year ending June 1, 1860.*

\* Included with "hats" in New York city, are straw goods to the value of \$18,500.

† In Newark—makes straw hats.

### SILK MANUFACTURES.

SEWING SILK, TWIST, &c.—The manufacture of silk from the raw state is neither extensive nor general in the United States. It is chiefly confined to the production of sewing silk, twist, fringes, laces, &c. These employed on the first of July, 1860, in three eastern and three middle States, 42 establishments, having an aggregate capital of \$1,675,900, and giving employment to 583 male and 1,996 female hands. The material used was 455,660 pounds of raw silk, valued, with other materials, at \$2,378,521, and the cost of labor expended upon it was \$387,312. The total product was 409,429 pounds of sewings, twist, &c., of which the value was \$3,596,249, or an average of \$8 78 per pound.

The principal producer in this branch was Connecticut, in which State the growth and manufacture of silk first obtained a permanent foothold in the United States, and where sewing silk was first made in this country by machinery upward of twenty-five years since. There were 19 establishments in the State, whose aggregate investments amounted to \$957,900. They employed 226 male and 833 female hands, at a total annual cost for wages of \$128,256, and from 150,060 pounds of wound silk, costing,

with other materials, \$797,720, or nearly \$5 per pound, made 145,835 pounds of sewing silk, twist, &c., valued at \$1,223,400. The product was more than one-third the total value made in the Union, and was of the average value of \$8 38 per pound. Of the total product in that State nearly one-half was the value made by two establishments in Hartford, one of which is probably the largest in the United States, and in the production of sewings, twist, and woven goods, that city and South Manchester employ a capital of \$600,000. The sewing silk of this company, which has been for some time in the business, is not inferior to any imported.

Next to Connecticut in this industry was the State of New Jersey, having 6 establishments, with a total capital of \$203,000. These employed 141 males and 548 females, whose wages amounted to \$105,120, and they consumed 121,500 pounds of raw silk, at a total cost for raw materials of \$621,675. The product was \$107,310 pounds of sewings, twist, &c., worth \$950,900, or \$8 86 per pound. Four of these mills were in the city of Paterson, which has about 10 establishments engaged in the several branches of silk manufacture, and produces goods to the value of upward of \$800,000 annually, a large proportion of these being sewing and embroidery silk, twist and floss silk. Two or three establishments in that place now make, tram and organzine, one of them being exclusively devoted to that manufacture.

Pennsylvania contained 8 silk establishments, employing 409 persons, and producing from 66,000 pounds of raw silk 61,500 pounds of sewing silk, &c., valued at \$598,000, an average of \$9 13 per pound. The principal establishments were in Philadelphia, where one house has been about twenty-five years engaged in the business, and a larger amount of silk goods of various kinds is produced than in any other city of the Union.

Four establishments in Massachusetts, having 240 hands, spun and twisted from 83,000 pounds of raw silk, costing \$391,800, 63,900 pounds of sewing silk, &c., worth \$579,950, an average value of about \$9 per pound. The annual labor cost \$55,152.

In New York 3 silk-spinning mills gave employment to 159 persons, and made from 29,100 pounds of raw silk 25,444 pounds of sewings, twist, &c., worth \$207,519, equal to \$8 15 per pound.

Two factories in New Hampshire employed 23 hands, which converted 6,000 pounds of raw silk into 5,440 pounds of sewing silk, valued at \$36,480, or about \$6 75 per pound.

The principal part of the material used in this and other branches of the silk manufacture was reeled and floss silk imported from abroad, and amounted in all of them to not less than half a million pounds of raw silk annually.

The value of raw or reeled silk imported in 1852 was \$360,836, and in 1853 \$712,092. In the fiscal year ending June 30, 1860, the value of silk, raw or reeled from the cocoon, imported free of duty, was \$1,235,976, and of raw silk, subject to ad valorem duty, \$104,700, in addition to floss silk of the value of \$12,903, paying a duty of 19 per cent. The reeled silk was principally from China and England, and the floss from England, France, and Germany.

In 1862 the importations of raw silk free of duty amounted to \$413,972, and on raw silk paying duty \$75,554, in addition to a small value of floss silk.

The value of sewing silk imported in 1852 was \$173,799; in 1853, \$238,525; and in 1860 the value of sewing silk and twist imported was \$234,986, subject to a duty of 30 per cent.

**SILK GOODS.**—In 1860 only one establishment was reported as making woven silk goods, which was at West Newton, in Massachusetts. It employed a capital of \$25,000 and 53 hands, all but 3 of them females. The total cost of materials was \$77,450; the annual wages \$12,168; and the value of the product, under the name of fancy silk goods, was \$118,000, which was about double its product in 1855. The goods made are understood to have consisted, in part, of ribbons and silk braid, the former woven on the braid-loom, with Jacquard attachment.

Since that time ribbons have been made in Philadelphia and at Hartford, Connecticut, and perhaps elsewhere, and some pongee handkerchiefs also at Hartford; cut and uncut silk velvets are said to have been made also at Valley Creek, Chester county, and at Economy, Beaver county, Pennsylvania, and woven goods also at Paterson, New Jersey.

**SILK TRIMMINGS, FRINGES, RIBBONS, &c.**—These and other narrow textile fabrics, including cotton tapes, braids, &c., are known in England under the name of “small wares;” in France, of “passamenteries,” and in the United States are generally denominated “trimmings.” The latter term includes ladies’ dress trimmings, carriage laces, curtain trimmings, cords, tassels, braids, fringes, ribbons, military trimmings, &c., &c.

Exclusive of coach lace, which is made a separate business by a number of factories, these articles, in 1860, were made by 90 establishments in one New England, four middle, and one western States. Their aggregate capital amounted to \$1,183,280, and the hands employed were 919 males and 1,788 females, whose annual wages cost \$618,380. The cost of material was \$1,416,819, and the value of the manufactured goods \$2,804,322.

Pennsylvania was the largest producer in this branch of the silk manufacture, having 27 establishments, all of them in Philadelphia and its vicinity, with a collective capital of \$708,700, and 1,150 hands, about two-thirds of whom were females. These expended yearly for raw material \$537,367, and for wages \$241,464, and produced silk goods to the value of \$1,169,845.

New York contained a large number (39) of establishments for making trimmings. Their capital amounted to \$241,780, and they employed 664 female and 333 male hands, whose wages amounted yearly to \$235,096. The raw material cost \$495,261, and the finished products were valued at \$944,377.

Fifteen establishments in Massachusetts, with 488 hands, one-third males, produced fringes, &c., to the value of \$399,100. The cost of material was \$345,720, and of labor \$124,400 per annum.

Two establishments in New Jersey made silk goods of this class to the value of \$10,000 annually; three in Maryland made \$39,800 worth, and four in Ohio produced a value of \$41,200.

Included in the product of this branch is more or less coach lace made by one large establishment in Philadelphia, and some in other places who make ladies’ dress trimmings, from which it is not separated in the returns.

The quality of the dress trimmings made in these establishments is probably equal to any imported, and the designs in many cases are original with the manufacturers. The largest establishment is in Philadelphia, and, besides 130 coach-lace looms, employs 60 power-looms, 50 hand-looms, and upward of 150 Jacquard machines, ranging from 40 to 800 needles, 100 plaiting or braiding machines, and 336 silk spindles, with other complete machinery, much of it of original design.

**COACH LACE.**—The manufacture of coach lace employed, in 1860, according to the returns of six establishments, of which three were in Connecticut, two in New York, and one in New Jersey, making coach lace exclusively, in addition to what was made in several establishments engaged principally in dress trimmings, fringes, &c. The aggregate capital devoted to this manufacture was \$42,800, and it employed altogether 96 persons, of whom 16 were females, at a total annual cost for wages of \$32,364, and for material, (including 1,305 pounds of raw silk,) of \$28,987. The value of coach lace made was \$89,200.

Of these amounts, \$40,000 in capital, 62 male and all the female hands were returned by three establishments in Connecticut, which also reported \$78,000 of the total products as the yearly value of their manufactures. These factories consumed 1,131 pounds of raw silk, costing, with all other materials, \$24,087, and paid for labor \$27,504. Two of these establishments were in Bridgeport, and, with 50 hands, of whom 9 were females, produced coach lace and trimmings to the value of \$55,000, and the same articles were made at Hartford to a considerable amount. Two in New York made coach lace to the value of \$2,400; and one in New Jersey, employing 15 hands, produced a value of \$8,800.

#### HISTORY AND STATISTICS.

In Virginia, Carolina, Georgia, and some of the middle and eastern States silk husbandry was introduced and liberally encouraged almost with their first settlement. These attempts, although from various causes unsuccessful in establishing the production and manufacture of silk as extensive or permanent branches of industry, have fully shown that in soil and climate the United States is adapted to

the raising of silk equal in strength and fineness to any in the world. Various knitted and woven fabrics, as well as sewing silk, have been produced from a very early period from home-grown silk, even with the rude appliances of household industry, and goods are still made in regular establishments, which clearly prove that the possession of a cheap raw material is alone wanting to render the manufacture of silk a profitable industry.

The public attention has, at different periods in our past history, been much more strongly directed to the subject of silk than at present. A revival of a portion of the interest formerly manifested in the culture and manufacture of silk seems to be desirable, in view of its beauty and excellence as a material, the facility with which it may be raised, and the very heavy importations of foreign products annually required to meet the demand.

Heretofore, the low tariffs of duty, and the absence of suitable machinery for carrying forward the manufacture of silk from the cocoon to its more elaborate products, have restrained our manufacturers from investing their capital in competition with the cheap labor of Europe and China, and at the same time have prevented any general attention to silk husbandry in the United States. To this may be added the revulsion created in the public mind by the failure of speculative measures put forth about thirty years ago in connexion with the Chinese mulberry, or *multicaulis*, which proved to be unsuited to our soil and climate, and involved many in utter pecuniary ruin, without in anywise proving that silk-growing was either impracticable or profitless. With the abundant protection now furnished by the financial system, which has become a necessity, and which must continue for a considerable time to be the policy of the nation, the present seems to be a fitting time to revive attention to silk-raising, which will doubtless one day become a remunerative branch of agriculture in the United States.

The amount of raw silk imported during several past years has already been stated in connexion with the manufacture of sewing silk.

According to the census of 1850 the quantity of silk cocoons produced in 27 States of the Union in that year was 10,843 pounds, of which amount Tennessee, New York, Kentucky, and Ohio were respectively the largest producers in proportions approaching an equality.

In 1860 the total weight of cocoons returned was 11,944 pounds, including 120 pounds raised in Nebraska. Ohio was much in advance of all others, having produced 7,394 pounds, of which upward of one-half was raised in Tuscarora county. Illinois was next, and produced 1,547 pounds of cocoons, chiefly in Edgar and Randolph counties.

As early as 1623 all settlers in Virginia were ordered to plant mulberry trees for silk worms, and silk made from material grown in Virginia is said to have been worn by Charles II at his coronation in 1651, which was only about thirty years after the introduction of silk-weaving in England. In 1662 every proprietor of land in Virginia was required by the assembly to plant and fence ten mulberry trees for each hundred acres of land owned by him, and 50 pounds of tobacco was at the same time offered as a premium for every pound of wound silk produced. Two years later the bounty was claimed by several persons, including a member of the assembly, who had 70,000 mulberry trees growing. In 1666 all acts for the encouragement of silk in Virginia were repealed.

In Carolina silk-raising was early attempted under the direct patronage of the King, and in 1693 was revived in the parish of St. Thomas by Sir N. Johnson, whose plantation long bore the name of "Silk Hope." A Swiss colony, which settled at Purrysburg, in South Carolina, in 1733, made silk-growing a principal object, and persevered for some time. Silk was also raised by the French settlers of that State and wrought up with their wool. It was a fashionable occupation with ladies in that province down to the Revolution to raise silk, which they sent to England to be manufactured. Small quantities of raw silk, said to have been of excellent quality, and amounting to 251 pounds, are mentioned among the exports in several years between 1742 and 1755. In the last of these years the mother of the two Generals Pinckney is said to have had three dresses made in England from silk raised and spun by herself near Charleston, one of which was presented to the Princess of Wales and one to Lord Chesterfield. Ten years later 630 pounds of cocoons were raised at Silk Hope, and in the following year, in consequence of bounties offered by the Society of Arts in London for colonial silk, one

thousand pounds was voted by the assembly of Carolina to establish a filature for reeling silk in the province. Several hundred pounds were paid by the society in premiums previous to the withdrawal of the bounties in 1772.

The cultivation of silk and indigo was introduced into Louisiana by the French in 1718, and also at New Bordeaux, in Georgia.

It was a prominent object in the settlement of Georgia by the English to raise silk, and very liberal appropriations were made by Parliament and by private subscription for its encouragement. Lands were granted on condition of planting ten white or Italian mulberries for each acre, and were augmented in proportion to the increase beyond that number. The public seal of the colony bore a representation of silkworms at work, and an appropriate motto; Italian silk reelers were sent thither to take charge of a filature. The first raw silk was sent thence to England in 1734, followed by other lots, which were organized by Sir Thomas Lombe, at his famous silk mills, established at Derby, in 1719. In 1738 a rich brocade silk was woven from Georgia, at the request of Queen Caroline, who wore it as a court dress at her next levee. Indeed, so successful were the first efforts to promote silk growing in Georgia, that samples of silk from the province were pronounced, by silk weavers in Europe, to be equal to the best Italian, and it occasionally sold higher in London than any other silk. In 1749 Parliament admitted silk from Georgia free of duty, and two years after a public filature or silk house was established at Savannah, to instruct the people in the management of private filatures. In about seven months of 1751, 6,300 pounds of cocoons were received at the filature. Silk to the value of \$8,880 was exported from the province in 1750 and the three following years. And in 1759 about 10,000 pounds of raw silk were exported, which sold two or three shillings a pound higher than other silk. The filature was destroyed by fire in 1758, but was rebuilt the next year, and received during the next eight years 100,000 pounds of cocoons, much of which came from the German settlement at Ebenezer. These essays in silk raising in Georgia, which were the most extensive and successful in colonial times, were much the fruit of liberal bounties by Parliament and by societies in England and the province. On the reduction, in 1766, of the bounty paid by government for cocoons, from three shillings to half that sum per pound, the production of raw silk in Georgia fell off, from 20,000 pounds of cocoons in that year, to 290 pounds in 1770. But, in 1769, a bounty of twenty-five per cent. on the value of all raw silk imported from the colonies during the next seven years, to be reduced to twenty and fifteen per cent. during the next two terms of seven years, again stimulated the cultivation of silk, especially among the saltzburgers at Ebenezer, who annually sent to England several hundred pounds of raw silk, until the Revolution put an end to it nearly altogether. The last silk offered for sale in Georgia was in 1790.

Silk was the subject of legislation in Connecticut as early as 1732. In 1747, Governor Law, of that colony, wore the first coat and stockings made of New England silk; and, in 1750, his daughter wore the first silk dress of domestic material. In 1760, Nathaniel Aspinwall, of Mansfield, commenced the silk culture at that place and New Haven, with white mulberries from Long Island. In 1763, Mansfield produced 273 pounds, and the growth and manufacture of silk have ever since been a prominent industry of the place. In 1767, William Hanks, of the same place, raised sufficient silk to make three dress-patterns; and, with others, owned large nurseries of mulberry trees in Windham county. A filature had already been erected at Lebanon. President Stiles, of Yale College, Rev. Jared Eliot, Mr. Aspinwall, and others, labored zealously for many years to direct attention to silk growing, and their own and many other families had various fabrics of silk woven in England, or spun and knit by themselves from domestic silk of their own raising. Though nearly suspended by the Revolution throughout the country, silk raising was never quite abandoned in Connecticut. After the return of peace, bounties were offered for mulberry trees and raw silk, and a company was incorporated, in 1788, to manufacture silk fabrics in the State. Mansfield, the next year, produced 200 pounds of raw silk, worth \$5 a pound. About fifty families, at New Haven, were engaged in raising cocoons in 1790; and

twenty-nine families in Norfolk raised and spun 1,200 run of silk the same year. A woman and two children could make ten or twelve pounds in five to seven weeks.

Silk was also raised at Newport, Rhode Island, in 1758; and, in 1769, a gentleman of Boston offered premiums of ten to forty dollars, each, for the largest lots of mulberry trees raised in that colony, where a manufactory of silk was established about the same time. Fine samples of sewing silk were made in Worcester county and elsewhere in Massachusetts in 1790; and 40,000 yards of silk and thread lace at Ipswich, which had carried on that business for some years.

In New York, New Jersey, and Pennsylvania, the silk culture was early recommended and encouraged, and a filature was opened at Philadelphia in 1750, under the patronage of Dr. Franklin and other prominent men in those provinces. Considerable quantities of cocoons were brought to it by the people of the neighborhood, to be sold or reeled for the owners, but it appears to have been abandoned during the Revolution. Much sewing silk was made in families, and, among others, by Susanna Wright, a Quakeress, of Lancaster, who was awarded a premium, in 1770, for sixty yards of mantua dress silk, made from cocoons of her own raising. A manufactory of bolting cloth, from Georgia silk, is said to have been established at Wilmington, Delaware, in 1796, previous to which time, Mr. Aspinwall, of Connecticut, endeavored to revive the mulberry culture in the middle States.

The *manufacture* of silk in the last century was chiefly of domestic material, which was more plentifully produced than at present, and with the exception of a lace mill at Ipswich, Massachusetts, and one or two other less successful attempts, was chiefly of sewing silk, hosiery, &c., though ribbons, handkerchiefs, buttons, &c., appear to have been made to a small amount in Connecticut.

The first mill in America for making sewing silk and twist by water-power is said to have been built by Rodney Hanks, in Mansfield, Connecticut, about fifty years since. Two other mills, on the same stream, have since been erected and operated by successive generations of the same family, each mill larger than its predecessor, and with improved mechanism for the winding and twisting of sewings and twist, which are still produced of a quality probably equal to any in the world. The first manufacture of sewing silk by machinery in the United States has also been attributed to Messrs. Conant & Atwood, of Mansfield, about the year 1829.

The census of 1810, in addition to the product of one silk manufactory in Burlington county, New Jersey, which made 1,800 yards, (probably of coach lace,) valued at as many dollars, reported a manufacture of sewing silk and raw silk in Massachusetts and Connecticut, to the value of \$29,121, the greater part of it made in three counties of the latter State, which was nearly the only one that continued to produce the raw material. In 1814, when silk rose to \$30 a pound, the Newark, New Jersey, lace factory obtained all its floss silk from Connecticut.

The value of raw and sewing silk made in Windham county, in 1825, was \$54,000, or double its product in 1810. Three-fourths of the families in Mansfield were engaged in raising and spinning silk, the sewings being made in families with no other implements than the common spinning wheel, large or small, and common reel. In 1831, the value of sewing silk made there was \$81,000. Silk fabrics were occasionally woven in common domestic hand looms. Sewing silk was also made in Kentucky and some other States at that time. About that time a machine was introduced at Philadelphia for winding silk from the cocoons and doubling and twisting it at the same time, operations never previously combined in one machine.

In 1835, Gamaliel Gay, of Baltimore, patented an invention for winding silk from the cocoons upon bobbins or spools instead of reels, which came into general use as an improvement. During the same year he also patented a power loom for weaving silk goods, which was deemed a valuable invention. Several improved reels were introduced about the same time by Mr. Cobb, of Massachusetts, Mr. Smith, of Baltimore, and others.

Previous to this time a growing interest had been excited in the silk culture and manufacture by the introduction of the *morus multicaulis*, which was asserted to be superior to any other species of mulberry as food for the silkworm. In 1830 an experimental filature, with all the latest improve-

ments, was established at Philadelphia, by Mr. D'Homergue, a French manufacturer, P. S. Duponceau, and others, who publicly advocated a system of filatures throughout the country as the only effective means of promoting the silk industry in the United States.

The production of a good quality of ribbons in Baltimore, of silk handkerchiefs, cravats, and other woven goods in Connecticut, led to the introduction in Congress of the celebrated silk bill, drawn up by Mr. Duponceau, and designed to encourage silk husbandry and manufactures. It was debated for one or two sessions, and finally rejected, although specimens of gros de Naples dress silks, woven in England, and other fabrics made in France, and a silk banner made in Philadelphia by Mr. D'Homergue, were produced as evidences of what could be done with domestic silk. Excellent black silk plush was made in Philadelphia, in 1831, by Mr. Joseph Ripka, and figured silk vestings and other woven goods at Economy, Pennsylvania, by Mr. Rapp, about the same time.

Although the proposed aid was not obtained from Congress, the imposition of a duty of twenty-eight per cent. on imported sewing silk, the introduction of the power-loom, local bounties, and the general excitement on the subject of the mulberry culture and silk raising, led to the organization of silk companies in several parts of New England, New York, and other States. In 1833, it was stated that one dozen silk mills had been erected in the United States, chiefly in New England, since 1828, for the manufacture of silk goods from imported raw silk, in the expectation that the general interest in silk growing would soon produce a domestic material in abundance. One factory at Mansfield, at that time, employed thirty-two spindles for soft silk winding, and had apparatus for winding hard silk, and two broad silk looms, and one fringe loom. Its machinery was sufficient to employ thirty broad silk looms and fifty hands. About 30,000 sticks of twist, worth \$4 50 per hundred, were made by one manufacturer in that place. The New England Silk Company, at Dedham, with a capital of \$50,000, employed, in 1835, sixteen sewing silk machines, and made preparations to produce 200 pounds weekly. In the following year it produced \$10,000 worth of silk and silk mixed fabrics. A manufactory at Boston, employing 300 females and between 100 and 200 looms in weaving Tuscan braid for ladies' bonnets, a business which, at this time, created quite a demand for sewing silk, also contained a ribbon loom, with one dozen spring shuttles, weaving twelve ribbons at a time, with the aid of a single operative. It also included a throwing mill for making organzine and tram for warp and filling, and manufactured *gimp* and *galloon* on a loom with twelve shuttles, managed by a single hand. The Rhode Island Silk Company, at Providence, previously known as the Valentine Company, about this time erected power looms, of Mr. Gay's pattern, to manufacture about 300 yards per week of rich and heavy silk goods by steam power.

A national silk society was organized in 1838, which established a national silk journal, devoted to this interest. But, during the following year, the multicaulus speculation, from an originally healthy trade in mulberry trees and a proper interest in silk raising, had degenerated into a ruinous competition in the cultivation and sale of trees. Although much raw silk was raised, and either made into sewings, hosiery, and other fabrics in families, or sold to the regular establishments, and one gentleman, at Germantown, Pennsylvania, was supposed to have the largest cocoonery in the world, the supply of raw silk was inadequate to the wants of the manufacturers, and many of the companies previously formed sunk nearly their whole investments. Foreign manufactures of silk, except sewing silk, were admitted free of duty, and our manufacturers could not sustain themselves against the enormous importations, while dependent on the foreign materials, or the uncertain supply of domestic silk.

In the twenty-one years from 1821 to 1841 inclusive, the total importations of foreign silks amounted in value to \$210,541,051; of which value, only \$26,827,285 was exported, leaving for home consumption an average of \$8,748,274 annually. In 1839, these imports amounted to nearly \$24,000,000, or about double the value of any other article imported. It included sewing silk to the value of \$809,534. The value of raw silk imported in the last five of these years (1837 to 1841) was \$769,227, whereof \$620,719 was exported.

In 1842, Congress laid a duty on raw silk imported, and on all other kinds not more advanced than singles or tram, of 50 cents a pound, except floss silk, which paid 25 per cent. ad valorem. Sewing silk was charged with a duty of \$2 per pound; silk lace, gloves, mits, hat bands, caps, cords, tassels, ribbons, and piece goods, \$2 50 per pound; silk hosiery, 40 per cent.; and other silk goods, 30 per cent. ad valorem. In 1846, the rates of duty on several articles were reduced; and in 1857 still further reduced. Raw silk, which in 1846 was charged 15 per cent., was, in 1857, placed on the free list.

In 1842, considerable quantities of silk and worsted vestings were made at a large factory in Baltimore, which employed fifteen or twenty Jacquard looms, and used domestic silk. But such was the prejudice in favor of foreign goods, that these articles could not be profitably placed in the market as American manufactures. The silk manufactory of J. W. Gill, at Mount Pleasant, Ohio, erected about 1838, and claiming to be the first regularly organized silk factory in the United States, under the superintendence of Mr. Fox, an English manufacturer of thirty-five years' experience, had made, within two years, thirty-five pieces of velvet, of ten to twenty yards each, and worth \$4 to \$6 a yard; ten pieces of plush, from which were made twenty-four dozen silk hats, worth \$48 per dozen; 100 pieces of dress silks, flowered vestings, &c., in length from ten to thirty yards each, and valued at \$1 to \$3 a yard; and about sixty dozen cravats and pocket handkerchiefs, worth \$1 to \$1 75 each, besides lustrings and other articles. All of these goods sold readily. All but the weaving machinery was propelled by steam-power, and the goods were made at a profit of ten per cent. There were still other manufactories of sewing silk, fringes, tassels, gimps, coach lace, &c. The uniform testimony of those employed in the factories (some of whom had followed the business for twenty or twenty-five years in England) was, that they never saw finer or as fine silk as the American when properly prepared. It was said to make a stronger thread than foreign silk, and by many manufacturers was altogether preferred.

Under legislative protection the manufacture of sewing silk in the United States continued to increase until about the year 1844, when the whole quantity reported was 396,790 pounds, exclusive of what was made and used in families; of that quantity 176,210 pounds were made in Connecticut. The quantity reported as made in Massachusetts the next year was 22,509 pounds, valued at \$150,477; that of raw silk being 194 pounds, worth \$952. A duty of fifteen per cent. was laid on imported raw silk, which caused the manufacture of sewings to decline for a number of years, although it was never abandoned. In 1855, Massachusetts made 44,000 pounds of sewing silk, worth \$300,000, in the three counties of Hampshire, Essex, and Norfolk. That quantity was exclusive of fringe and tassels, made chiefly at Roxbury, to the value of \$433,000; and of ribbons and dress trimmings, &c., to the value of \$38,000, by one establishment, at Newton.

The State census of New York, for the same year, reported six sewing silk factories, three of them run by steam power, which made, with the labor of 236 hands, \$212,000 worth of sewings; seven fringe and tassel establishments, all but three of them in the city of New York, making together a value of \$280,500; and two ribbon mills, whose product was of the value of \$15,900, all but \$900 of which was the product of one mill in the city. The silk mills at Mansfield, Willimantic, South Coventry, and elsewhere in Connecticut, each made, at that time, from 100 to 300 pounds of silk, for sewing machines, saddlers' and embroiderers' silk, machine twist, fringes, &c., of all colors and of superior qualities. Excellent dress silks have since been made in that State by at least one factory, at Hartford, which afterward abandoned it for the manufacture of silk handkerchiefs. There were, at the same time, sewing silk mills in other parts of the country, the most considerable of which was at Paterson, New Jersey. A small factory, at Newport, Kentucky, about the same date, employed five or six looms in weaving silk dress goods, handkerchiefs, and cravats, chiefly the last mentioned; and silk braid, fringes, and ribbons, were made at Philadelphia. The weaving of brocatelles by the power loom had been recently commenced at Seymour, Connecticut; but, we believe, did not succeed.

The manufacture of silk and thread lace and edgings, &c., was carried on at Ipswich, Massachusetts, quite extensively in the last century. In 1790, nearly 42,000 yards were made at that place by

women and children and sent to Boston for sale or exportation. Samples of thirty-six different styles of these articles were exhibited on pattern cards. The census of 1810 reported 743,090 yards of web lace and fringe, worth \$109,540, made in the United States, chiefly in Pennsylvania, Massachusetts, and Rhode Island, but the materials are not given. In 1824, the Boston and Ipswich Lace Factory, at Ipswich, was incorporated, with a capital of \$150,000, to make bobbinet lace by machinery. It employed for a time about 800 young women on lace work, but was compelled, about three years after, to discontinue the business. Lace was also made to a large amount at Medway, Massachusetts, in 1823, with machines which would each turn out, daily, fifty yards, five inches wide, worth \$2 a yard. A lace factory, at Newport, Rhode Island, in 1827, employed about five hundred females. Three years later the value of domestic lace made in the country was estimated at fully \$500,000.

In 1833, the New England Lace Manufactory, at Newburyport, Massachusetts, was incorporated, but also proved unsuccessful.

Coach lace was made before and during the last war with Great Britain, at Newark, New Jersey, from Connecticut floss silk, which was thought to be superior for that purpose to any imported. At that time only two patterns, known respectively as the "Jefferson" and "Monroe" patterns, were made in the country. In 1815, Mr. W. H. Horstmann commenced the manufacture of trimmings in Philadelphia, and, in 1824, introduced from Germany, where he had acquired a thorough knowledge of the business, the braiding and plaiting machines, and in the following year the Jacquard loom. The establishment has since become the most extensive, complete, and varied, in its products of silk and worsted trimmings and narrow textile fabrics, anywhere to be found, and was one of the first in this country to apply the power-loom in making several articles of this class, gold laces having been made by power in Philadelphia several years before it was attempted in Europe. Previous to 1837, however, coach lace was altogether made on hand-looms. About that time, Mr. Erastus B. Bigelow, of Massachusetts, who had previously devised a hand-loom for weaving suspender webbing, a machine for making piping cord, and a power-loom for weaving knotted counterpanes, after only six weeks study over a piece of coach lace, brought forward the loom for weaving coach lace by power, then deemed an impossibility by the principal manufacturers and dealers. It was patented in April of that year, and was afterward modified and matured into the Brussels and tapestry carpet looms mentioned elsewhere. The "Clinton Company," at Lancaster, Massachusetts, was organized, and one hundred of the curiously automatic and very ingenious coach lace looms, during the next twenty years, made annually between one and two million yards of coach lace, of worsted, cotton, and silk, variously combined, according to quality, the best qualities being almost wholly made of silk. In 1857, the stock, looms, and patent rights of the Clinton Company, then the largest manufacturers in the United States of coach lace, became the property of the Messrs. Horstmann, who have since employed 130 coach lace power-looms, in addition to 100 power-looms on other fabrics, 336 silk spindles and other very complete silk machinery, 400 plaiting or braiding machines, 50 hand-looms, using upward of 160 Jacquard machines, &c., constituting one of the most interesting establishments in any country for the production of ladies' dress trimmings, coach laces, upholstery trimmings, regalia, and military trimmings and equipments.

At the present time the silk manufacture is probably on the increase in the United States. Under the efficient protection afforded by the present revenue laws, it is to be hoped that both the raising of raw silk and its ultimate manufacture may be greatly extended throughout the country.

# INTRODUCTION.

ciii

*Statistics of silk manufactures in the United States during the year ending June 1, 1860.*

STATES.	Number of establishments.	Capital invested.	Raw silk used.	Cost of raw materials.	NUMBER OF HANDS EMPLOYED.		Annual cost of labor.	Annual value of product.	Sewing silk and twist.

## LINEN MANUFACTURES.

With the exception of cordage, the manufactures of hemp and linen in the United States have never been general or extensive. At present they are confined chiefly to two States, and to the production of a very limited number of products.

In 1860 this industry employed, in the two States of Massachusetts and New York, ten establishments, having an aggregate capital of \$639,795, and 528 hands, of whom 277 were females. The total cost of labor was \$113,048, and of material, \$327,770 per annum. The latter sum embraced the value of 998 tons of flax used, from which were manufactured woven goods, twines, and thread, to the value of \$699,570.

The number of establishments returned from Massachusetts was three, which represented a capital of \$490,000, and consumed 695 tons of flax, costing, with all other materials, including some hemp and cotton, \$228,575. They gave employment to 159 male and 167 female hands, whose labor cost annually \$73,800. The manufactured product was chiefly crash towelling, of which 6,200,000 yards were made, and valued at \$515,000.

One of these establishments was at Dudley, in Worcester county, and ran five sets of machinery by water-power, consuming 300 tons of flax, and making 2,000,000 yards of crash, worth \$150,000. The Hampden flax and hemp mill, at Ludlow, manufactured linen, hempen, and cotton goods to the value of \$65,000, of which \$18,000 was of flax; and the American Linen Company, at Fall River, which was the largest, ran 4,000 spindles and 200 looms by steam-power, producing, from 350 tons of

hemp and flax, 4,000,000 yards of crash, &c, worth \$300,000. This product was exclusive of some twine and shoe thread made in the State from flax, tow, and Manilla hemp, which is included in the statistics of cordage.

The linen mills in New York numbered seven, and were of smaller extent, aggregating a capital of \$149,795, and a total cost for material of \$99,195, and for labor of \$39,248. These establishments gave employment to 92 males and 110 females; and consumed 303 tons of flax, from which were manufactured goods valued at \$184,570. The products included 518,000 pounds of sewing thread, twine, and shoe thread. One establishment, the American Linen Thread Company, made 160,000 pounds of linen thread, valued at \$80,000, an average of fifty cents a pound. It employed 50 male hands and 60 females.

The cultivation of flax in the United States for the sake of its fibre is much less general than formerly. With the increase of the cotton culture and manufacture, and the improvements in cotton and woollen machinery, cotton has been extensively substituted for flax and hemp even in household manufactures, which have generally been abandoned for the products of regular factories, either domestic or foreign. Large areas in some of the western and middle States are still devoted to the cultivation of flax for the production of oil from the seed, which has made it a remunerative crop.

The quantity of hemp and flax raised in the United States in 1840 was 91,251 tons. In 1850, the weight of dressed flax produced was 7,709,676 pounds, or 3,854½ tons, of which Kentucky produced 2,100,116 pounds, and Virginia upward of 1,000,000 pounds. The product of hemp was 34,871 tons. The value of the flax fibre was \$770,967, and the quantity of flaxseed produced in the same year was 562,312 bushels, valued at \$843,468. The area of land cultivated in flax was estimated at 100,000 acres. In 1860, the total weight of flax reported was only 4,720,145 pounds, and of flaxseed 566,867 bushels, a decrease in the former of 2,989,531 pounds, or upwards of 38 per cent. Only two States, New York and Ohio, showed an increased production of flax, while the product of Kentucky alone fell off to 728,234 pounds. The product of flax in 1850 was in the proportion of less than 5½ ounces to each inhabitant of the Union, and in 1860 was less than 2½ ounces to each person.

Since the taking of the census, and particularly during the late war, the home production of flax has probably been increased, as its manufacture undoubtedly has been, and will be still further increased by reason of improvements in flax-dressing machinery, and in the various processes by which its filament has been assimilated to that of cotton, so as to be spun on cotton machinery, either unaltered or slightly modified. With a soil and climate admirably adapted to the culture of flax and hemp, and with the increased price of all textile materials, we may confidently look for a notable increase in the production of flax and hemp, which can be made profitable crops in nearly all the States and Territories. It will be required by our manufacturers for incorporation with wool and cotton in various mixed fabrics not included in the foregoing statistics, as well as for pure manufactures of these materials, now subject to high duties.

In the fiscal year ending June 30, 1852, the importations of unmanufactured flax, chiefly from England, Russia, and Holland, and subject to a duty of 15 per cent. ad valorem, amounted to 3,162,208 pounds, valued by the custom-house at \$175,342; and of codilla or tow of flax and hemp, 686,224 pounds, worth \$35,717.

In 1860, the value of flax imported in the unmanufactured state, duty free, was \$213,687, and in 1862 it was \$175,870, or about the same as in 1852; for less than half the quantity imported in that year, or 1,421,628 pounds, entered at a duty of \$15 per ton.

Of manufactured flax, the total value imported in 1852, subject to a duty of 20 per cent., and including bleached and unbleached linens alone to the value of \$7,603,603, was \$8,516,109. And of hempen manufactures, exclusive of cordage, \$391,608. In 1860, the value of linens imported was \$9,245,816; and of all other manufactures of flax, \$1,490,519; the duty on which was about 15 per cent. ad valorem. The manufactures of hemp, exclusive of thread and twine, imported the same year, amounted in value to \$767,135.

In 1862, 15,456,358 yards of linen, valued at \$2,894,314, and other manufactures of flax to the value of \$3,173,672, were imported, the latter sum including thread and twine valued at \$876,057. Of hempen manufactures, exclusive of cordage, the value imported was \$1,471,193. The duty on all costing less than 30 cents a yard was 25 per cent, and when costing over that price, 30 per cent.

## HISTORY AND STATISTICS.

As flax and hemp, in former times, held relatively a much more important place among textile materials than at present, the first colonists of America, many of whom were from the flax-growing and linen districts of the British islands and of Germany, encouraged their cultivation from the outset, and chiefly as a material for household stuffs.

Flax was cultivated in New Netherlands as early as 1626, and three years later the seeds of flax and hemp were sent to Massachusetts. In 1640, a public order was made in Massachusetts respecting the manufacture of linen cloth, by ascertaining how much seed there was in every town, and what persons skilled in breaking, spinning, and weaving; and, also, what means should be taken for teaching all boys and girls to spin. Later in the same year, a bounty of 3*d.* for every shilling's worth of linen, woollen, and cotton cloth, made in the province, was offered and paid the next year to several persons for 83 yards, valued at 12*d.* a yard, which was probably of flax, and possibly the first products of the loom in this country. About the same time, flax and hemp were ordered to be sown by each family in Connecticut to preserve seed, and, as the act reads, "that we might in time have supply of linnen cloath amongst ourselves." Inspectors of linen and woollen yarn, with power to regulate their price, were appointed in the latter colony in 1644.

In 1641, the authorities of Salem, Massachusetts, set apart an acre of ground to Samuel Cornhill for the cultivation of flax, in a locality which, until near the present date, has borne the name of the Flaxponds. The heads of families were, at the same time, required to instruct their children and servants how to gather and improve the wild hemp, "growing wild all over the country," probably the *apocynum canadinum*, or Indian hemp, a species of dogbane, from which the Indians made clothing, bow-strings, nets, mats, lines, &c.

In 1670, the people of New York were said to make all their own linen, in which they excelled; and three years later the collector of customs reported that no linen was made in New England worth above 2*s.* 6*d.* a yard. Materials for linen were plentiful in New Jersey in 1684, flax, twice heckled, selling for 9*d.* a pound; and the German settlers of Pennsylvania had already commenced the making of linen and hosiery, which afterwards became noted products of that province.

Queen Elizabeth is said, by an early writer, to have worn some fabric made of a native fibrous material called silk grass, growing abundantly in Virginia. Captain Matthews, an early settler of that colony, cultivated and manufactured flax and hemp quite extensively previous to 1650. In the following year premiums were offered for the cultivation of hemp, and in 1657 for flax. In 1662, two pounds of tobacco were offered for every pound of these materials prepared for the spindle, and three pounds for every yard of yard-wide linen made; every tithable person being, at the same time, required to produce annually two pounds of dressed hemp or flax.

An act of Parliament, passed in 1704, for encouraging the importation of naval stores from the plantations in America, gave a bounty of £6 on each ton of water-rotted hemp sent to England, which secured considerable attention to the production of that staple, and the domestic manufacture of linens was discouraged by allowing a drawback on all foreign linens imported into England on their reshipment to America, and also by bounties on the export of British and Irish linens.

The first considerable improvement made in the domestic manufacture of flax and hemp, which though altogether of the household kind was quite extensive, was by the introduction of the linen or foot spinning wheel for spinning flax. It was introduced in New Hampshire about the year 1719 by the Protestant Irish, who settled at Londonderry, and also brought with them a better knowledge of the flax culture, and, it is said, introduced that valuable esculent, the Irish potato. Some of these

people also settled in Massachusetts, and their success in the linen manufacture induced the assemblies of Massachusetts and Rhode Island each, in 1722, to grant bounties of 20s. for each bolt of sail duck made in these provinces from domestic materials. These were paid by the former to John Powell, and by the latter to William Borden, each of whom received as additional encouragement a loan of \$3,000 from his government. Richard Rogers, of New London, Connecticut, also, in 1724, received a patent for making canvas for shipping, of which he presented excellent samples; but in 1735 he was refused like privileges for the manufacture of "fine linen cloth." Liberal premiums were also offered in these colonies for raising flax and hemp; and in Massachusetts, in 1734, surveyors were appointed of these commodities, which were so generally cultivated that for several years they were received at the public treasury in payment of taxes, flax at 6*d.* and hemp at 4*d.* a pound. About the same time, a large "spinning school" for the poor was inaugurated in Boston, with great public enthusiasm, and sustained by subscriptions and by a tax on carriages.

Similar bounties and encouragements were given in Pennsylvania and Maryland for the culture and manufacture of flax and hemp, and were continued in various forms in all down to the Revolution. In 1751, upward of 60 wagon loads of flaxseed entered Baltimore for exportation. And in the following year, as testified by Dr. Franklin before the House of Commons, 10,000 hogsheads or 70,000 bushels of flaxseed were exported from Philadelphia, and all the flax grown was manufactured into coarse linens. In 1771, the quantity thence exported was 110,412 bushels, and from New York in 1755, 12,528 hogsheads. In 1791, the exports of that article from the United States were 292,460 bushels, an amount never since equalled, and upward of one-half the total quantity produced in the United States in 1860, which was 566,867 bushels.

The diminished importations from Great Britain for several years preceding and during the Revolution, and the various measures adopted to supply their place by domestic products, including liberal bounties by Congress and by local committees for the production and manufacture of every kind of raw material and the construction of improved machinery, gave a new impulse to the flax and hemp culture. The household manufactures of linsey woolseys and other mixed fabrics, of wool and flax or cotton and flax, of tow cloth, osnaburgs, brown hollands, for women's wear, dowlas, bagging, &c., which formed a large part of the ordinary inner and outer clothing and household stuffs of the people, were very much extended and went far to supply the demand. Many small factories of sail cloth and other kinds of linen were organized in different places.

Of the latter article a large manufactory was erected in Boston about 1788, by an incorporated company, who were encouraged by a bounty on its manufacture, which it is said to have produced of a quality superior to any before made in America, and sold lower than imported sail cloth. The sails and cordage of the ship *Massachusetts*, of 800 tons, built about 1790, were wholly made in Boston, and two years after the factory referred to employed 400 hands, and made 2,000 yards of duck weekly. Its annual product for a number of years was between 2,000 and 3,000 bolts of 40 yards each, worth \$13 per bolt.

A manufactory of sail cloth was commenced at Haverhill, Massachusetts, in 1789, and others near the same time at Salem, Springfield, and Nantucket, Massachusetts, at Exeter, New Hampshire, and Newport, Rhode Island. Those at Salem and Newport, which were prosperous seaports, became flourishing concerns.

In 1796, the Globe mill, for spinning and weaving flax, hemp, and tow by water-power with patent machinery, was put in operation in Philadelphia by James Davenport. The labor was done chiefly by boys, each of whom was able to spin in ten hours 97,333 yards of flaxen or hempen thread, using 20 to 40 pounds of hemp according to fineness, and another could weave on the machinery 15 to 20 yards of sail cloth per diem. It was suspended in 1798 by the death of the proprietor. Several patents were recorded in the United States in connexion with this branch before the close of the last century. Kentucky supplied nearly the whole cotton country with baling linen in 1809.

The census of 1810 returned 21,211,262 yards of flaxen cloths made in families, &c., of which

the value of about 12,214,867 yards only is given, which amounted to \$4,507,571. About one-fourth of the whole quantity was made in New York, where the value of such cloths made was \$2,014,742. Virginia was next in the number of yards produced, which was nearly 5,000,000, but the value was not given. Connecticut manufactured upward of 2,250,000 yards, valued at \$800,359, and Pennsylvania almost 3,000,000 yards, of which the value was not returned. In Vermont 1,859,931 yards were made; and in New Hampshire and Ohio, upward of 1,000,000 yards each. The returns of that year also embraced 22,131,553 yards of blended and unnamed cloths and stuffs; 1,821,193 yards of mixed and hempen cloths chiefly mixed; 802,718 yards of tow cloth; 453,750 yards of bagging made of hemp for packing cotton, chiefly the product of thirteen establishments in Kentucky; besides some mixed and flaxen cloths, chiefly the former, made in Carolina and Georgia. There were also reported, as the product of manufacturing establishments, 3,025 pieces of sail duck made in Massachusetts and valued at \$80,813; other hempen cloths, to the value of \$12,148, made in Connecticut; and 36,714 yards of the same, probably bagging, manufactured in Philadelphia, besides 26 tons of hempen and flaxen yarn spun in six mills in that State.

Although labor-saving machinery, for spinning as well as doubling, trebling, and twisting, was then used to some extent both by water and steam-power in regular establishments, and some of these had been introduced into families, this extended manufacture of flax and hemp was almost wholly, as it then was in foreign countries, a household industry. Flax and hemp had for some years been regularly imported under a high duty in considerable amount to supply the demand, although the culture of these crops was quite general, as shown by the number of flaxseed oil mills, of which returns were made from fourteen States to the number of 383. They made 770,583 gallons of oil annually, valued at \$848,809, nearly two-thirds of which was the product of 171 mills in Pennsylvania. The quantity of hemp returned was 5,755½ tons, valued at \$690,625. In Connecticut, where the cotton manufacture was already somewhat advanced, the value of linen cloths of various kinds returned (exclusive of sewing thread, linen chain for mixed goods, tapes, bobbins, fringe, lace, webbing, &c.) was equivalent to 3.05 cents per capita of its population; and in Vermont linen was produced in about the same proportion, at an average value of 35 cents per yard. In the latter State and Pennsylvania, which made the fullest returns of spinning wheels, the number of these machines amounted to 200,000, of which two-fifths were supposed to be employed in flax.\*

The subsequent decline of the linen manufactures of the Union in relative value was undoubtedly attributable to the rapid growth of the cotton culture and manufacture, which furnished a more profitable crop to the southern agriculturist and a more available material to the manufacturer. The introduction of merino sheep about the same time, and of regular manufacturing establishments for both wool and cotton, also contributed to the decline of household spinning and weaving, into which flax and hemp entered largely as a material. The manufactories of sail duck previously established at Salem, Massachusetts, and in Connecticut and Rhode Island, had been abandoned or suspended on account of the high price of hemp, which rose in 1814 to \$275 per ton. The substitution of cotton duck about this time also operated against the extension of that branch of the linen manufacture.

In 1812 a patent was taken out in the United States by Mr. Charles Whitlow, of New York, for the manufacture of an indigenous perennial plant, found abundantly in western New York and other States, which had been occasionally used for making thread. It was supposed to be a species of nettle, and in honor of Mr. Whitlow, who claimed to have discovered its valuable textile properties, was called *urtica whitlowi*. About 500 pounds of dressed fibre could be produced from an acre, which was spun into six hank yarn, valued at \$11 per pound, at a profit of 50 per cent. A company was incorporated in New York the next year to manufacture the yarn, but with what success we are not informed. With the present increased demand for fibrous materials and improved modes of treating them, this plant, then thought superior to flax or hemp, may be deserving the attention of manufacturers.

\* Coxe's Statement of the Arts and Manufactures of the United States.

Since 1801 flax had been extensively cultivated on the German flats in Ontario county, in that State, and during the war its cultivation on an extended scale was commenced in Washington and Rensselaer counties, which have since been the principal flax-growing region of the State. It was found to be a profitable crop at 18 $\frac{3}{4}$  cents a pound, the current price; and in 1845 about 46,000 acres in the valley of the Hoosac were occupied with flax, producing 2,897,062 pounds. An incorporated linen company was in operation at Schaghticoke in 1814, and some others elsewhere in the State.

Many attempts have been made in Europe and the United States to introduce machines and processes by which flax could be dressed, spun, and woven with a facility and cheapness approximating those with which cotton is manipulated. A principal obstacle to the general use of flax as a textile material has been the expense of harvesting and preparing the fibre for the spindle. Instead of being pulled by hand, as in former times, the harvesting of hemp and flax is now done by the scythe or cradle or other machinery, which the cost of labor in this country renders indispensable. The former rude processes of breaking, scutching, and heckling have also given place to labor-saving machinery. The "boon" or woody envelope is broken and separated from the "hurl" or textile filament which it encloses by means of fluted cylinders, and the "shives" afterward shaken from the straw, while the scutching is effected by a series of swingling knives attached to a shaft and revolving rapidly in close proximity with the scutching board on which the flax is held. More expensive machines are also in use, which break and scutch the straw at the rate of one to two tons in ten hours, by a process of grinding and fanning, and are used in the preparation of flax cotton. These as well as several of the flax brakes and scutching machines with fluted rollers are adapted as well to unrotted as to rotted flax, though some loss of fibre occurs in the former case. A "portable flax and hemp dresser," of recent American invention, breaks and scutches the flax at the same time by means of fluted rollers of peculiar shape, and in its most improved form, it is said, enables five men and two boys with the power of two horses to prepare one thousand pounds of clean fibre daily. It is equally adapted to rotted or unrotted flax, and to the preparation of long-line flax and tangled flax or tow, and by many is considered the best in use. Other machines are in operation designed more especially to utilize the tangled straw of flax raised only for the seed, by converting it into short stock or tow of different qualities, and into "*fibrilia*" and "*erolin*," or flax wool, &c., in which the fibrils are so broken up and separated as to be carded and spun on cotton machinery. There are still others for preparing the fibre of other native or tropical plants, as the *Agave Americana*, &c., for textile uses.

Mechanical means alone, however, have never fully succeeded either in separating the filaments of flax from its cortical epidermis and woody core or boon, or in so "cottonizing" the fibre as to fit it for automatic spinning machinery. Other means have been long used for aiding the separation, by partially dissolving the glutinous substance by which the several tissues are united and the bast cells, which compose the separate fibres, are cemented together. Chief among these means are the processes known as dew-rotting, water-rotting, and steeping, in which a partial disintegration is effected by the aid of moisture. The simple immersion of the straw in a tank of soft water, as in water-rotting, produces an incipient fermentation, and sufficiently overcomes the adhesion of the parts for the subsequent operations of breaking and scutching. The process may be more expeditiously and perfectly effected by the aid of chemical solvents and of hot water or steam.

Of the latter description was the patented process of Mr. Schenck, an American, which consisted in steeping the flax in water warmed to 80° or 90°. This method, which has been extensively adopted in Ireland, favored the fermentative process, and reduced the time of preparation from two or three weeks to three or four days, (72 to 96 hours,) according to the quality of fibre, which was thereby improved and its product increased. The first rottery on this principle was established at Mayo, in 1848.

Chemical agency has also been used in China and Europe from an early period for disintegrating the fibres of flax and facilitating its preparation. The process which has attracted most attention is that of Chevalier Claussen, patented in England in 1850. By boiling the cut and crushed flax straw

first in a solution of caustic soda and afterward in dilute sulphuric acid, and then soaking it a short time in alkaline and acid baths, he was able in 12 to 24 hours to transmute it into a light, cotton-like material called flax cotton, adapted to the cotton spinning mill, and capable of being combined with wool, cotton, or silk, and also of being dyed like those materials.

This problem of preparing flax for spinning economically on cotton or other machinery had been long sought, and as early as 1840 Mr. Sands Olcott, in this country, operated machinery which enabled him to prepare unrotted flax for carding and spinning at eight cents a pound, and soon after he gave lectures on the subject of his improvements, which were suspended by his death. Mr. Slack, of Renfrewshire, in Scotland, also patented, in June, 1849, a chemical process somewhat analogous to Claussen's, which enabled him to make samples of excellent flaxen goods, spun and wrought on cotton machinery.

In January, 1852, the New York Agricultural Society offered a premium of \$100 for the best experiment in that State in the preparation of flax as a substitute for cotton. Near the same time the American Linen Manufacturing Company purchased the right of using Claussen's process in the United States; and prepared to put it in operation at Lockport, in that State, with a capital of \$500,000, of which \$350,000 was paid in and invested in buildings and machinery. They offered the highest price for prepared flax. Flax cotton prepared in this way and by other modes has been produced in different parts of the country, and several small cotton mills have been adapted for using short flax stock and hemp stock prepared by chemical agency, by the steam processes of Watt and of Buchanan, of Glasgow, or by mechanical means, separately or in combination, in the manufacture of coarse fabrics of flax or mixed materials. The cheapness of cotton, however, and certain defects still found in the Claussen method, prevented its general adoption. In July, 1861, when cotton had risen in price, the Rhode Island Society for the Encouragement of Domestic Industry, in addition to premiums previously offered, without conditions, for the first and second best bales of prepared flax cotton of fifty pounds each, offered a premium of \$500 for samples of that article with especial reference to its practical use as an economical substitute for cotton. In September, Stephen Randall, of Warwick, J. C. Butterworth, of Providence, and J. Knowles, presented bales of flax cotton; Hale & Farrar, of Jamaica Plains, samples of fine flax cotton and also of fine and coarse flax wool; and Mr. Anderson, of Louisville, Kentucky, specimens of carded flax, &c. Among manufactured products presented were 15 samples of colored flax and pieces of 37-inch sheeting containing 25 per cent. of flax, and other fabrics with 30 per cent. of that material.

Among the numerous producers and manufacturers of flax cotton, and cotton from hemp, from asclepias, cotton-grass, &c., is S. M. Allen, of Boston, who commenced experiments in cottonizing flax in 1851; and in 1858, with J. C. Butterfield and others, established at East Greenwich, Rhode Island, a mill with machinery adapted for working up *fibrilia* or fibrilized flax. The next year he fitted up a small mill at Watertown, Massachusetts, where calicoes and sheetings, half cotton and half flax, were made. H. McFarlane, of Rocky Hill, New Jersey, commenced making flax cotton by the Claussen process, on a commercial scale, in 1854, with such success as to be able to organize a company with a capital of \$200,000, whose product was chiefly sold at Lawrence, Massachusetts. Fuller & Upham, of Claremont, New Hampshire, R. Fletcher, of Oswego, E. Towne, of Utica, and C. Beach, of Penn Yan, New York, the last using mechanical means chiefly; H. Burgess, of Reyer's Ford, Pennsylvania; S. Roberts and George C. Davies, of Cincinnati; O. S. Leavitt, of Louisville, Kentucky, and many others, have been engaged in making or working up cottonized flax and other fibres. Among the mills that have been altered or established to manufacture this material are the Hope and Penn mills, at Pittsburg, Pennsylvania, which make the best quality of flax grain bags, and stock for batting for upholsterers; the Lockport mills, which make flax cotton twines of a high grade, brown and bleached stock for upholsterers, waddings, and coarse yarns; the Medina Flax Company's mills, at Medina, New York, producing similar goods to the last and of superior quality; the mills of Governor Smith and others, at Warwick, Rhode Island, making excellent grain bags, carpet warps, twine, rugs, &c.; the *Fibrilia*

Manufacturing Company, at Lawrence, Massachusetts, making printed carpetings, rugs, and crumb cloths, &c., from prepared flax and wool; the American Felting Company and the Mystic mills, at Winchester, Massachusetts, making carpetings, &c.; the Flax Leather Company, at Natick, Massachusetts, making fibrella leather for inside soles, heel stiffenings, &c.; the Berkeley Company, which makes carpet linings, &c.

The flax cotton prepared by Messrs. Fuller & Upham has been spun on cotton machinery into yarn as fine as No. 24, (cotton gauge,) and also woven as weft or filling into print cloth. The greater part of the flax cotton stock as now prepared by machinery is spun and woven into crash, osnaburgs, burlaps, and sugar cloths. It makes excellent twine, and when doubled for warp makes the best kind of grain bags. There are mills at Pittsburg, Pennsylvania, and some in Canada for preparing the flax fibre for the manufacturers.

In February, 1863, Congress appropriated \$20,000, to be expended under the direction of the Commissioner of Agriculture, for "investigations to test the practicability of cultivating and preparing flax or hemp as a substitute for cotton."

The commission appointed under this act have made a report, just published, which presents, on the whole, an encouraging view of the subject; but the commission, from the limited investigations it has been able to make of the subject, does not consider the preparation of flax cotton sufficiently developed to enable them to predict decidedly its ultimate success.

In the spinning of long-line flax by machinery, for which a large reward was offered in France in 1808, the first successful results were attained by the brothers Girard, at Paris, about two years later. At Leeds, Dundee, and Belfast, much greater perfection has since been attained in that respect. In 1826 a valuable machine for spinning flax, invented by the late Walter Hunt, was patented by Hunt & Haskins, of New York, which promised excellent results.

In 1849 the American Institute awarded Henry H. Stevens, of Webster, Massachusetts, the Talmadge gold medal, offered in 1847 by the president of the institute for the first and best piece of American linen spun by machinery and woven on the power-loom ever exhibited at its fairs. Linen thread of superior quality, spun by machinery, had been previously exhibited.

In 1855 the American Linen Company, of Fall River, Massachusetts, the first and only regularly equipped manufactory of linens on a large scale from long-line flax in the United States, exhibited at the New York exhibition a variety of power-loom linen fabrics of excellent quality, such as table-cloths, napkins, diaper sheeting, pillow-cases, towelling, coatings, crash, &c. The American Linen Thread Company, at Mechanicsville, New York, exhibited their patent thread, said to be equal to any imported.

Shoe thread and sewing twine are now made extensively at Andover, Massachusetts, where 650 tons of flax and tow, chiefly imported, are annually used; American flax being used for coarse yarns chiefly.

It is to be hoped that the experiments now in progress in cottonizing flax, hemp, and other fibrous materials, may result in a cheap and economical mode of utilizing the vast amount of flax fibre now annually wasted in the western States, where the plant is principally grown for its seed or for seed and lint. With the extension of our agriculture in the grain, cotton, and sugar regions of the south and west, the demand for cotton bagging, grain bags, sugar cloths, &c., will be immense, and the present tariff will so protect both the flax and hemp growers and the manufacturers, that we may hope ere long to be independent of foreign countries both for raw material and for nearly every product of the linen manufacture.

*Statistics of linen goods manufactured in the United States during the year ending June 1, 1860*

### HEMP AND MANILLA CORDAGE.

The manufacture of ropes and cordage in the United States is mainly confined to a few large establishments, although there are many small ones scattered throughout 18 States of the Union.

This industry on the 1st of June, 1860, employed in all 190 establishments, having invested an aggregate capital of \$2,938,289, and giving employment to 2,860 male and 618 female hands. The annual cost of raw materials used was \$5,665,320, and of labor on the same \$966,216. The total product of the manufacture returned was 40,346 tons of cordage, valued at \$7,843,339.

Of the whole number of establishments, 34 were in New England, 80 in the middle, 67 in the western, 7 in the southern, and 2 in the Pacific States.

Of the eastern factories, 30 were in Massachusetts, 3 in Maine, and 1 in Vermont. Their total capital amounted to \$762,400, the number of hands to 919, of whom 160 were females, and the annual product was 9,223 tons of rope and other cordage, worth \$2,163,316. The cost of material was \$1,616,097, and of annual labor, \$272,524.

The 30 rope-works in Massachusetts had collectively a capital of \$717,600, and employed 725 males and 152 females, at an annual cost for wages of \$260,096, and for material of \$1,533,442. They made 8,804 tons of cordage, valued at \$2,069,816. They consumed 8,783 tons or 17,566,000 pounds of hemp and flax, &c., at an average cost of 8½ cents a pound. These establishments included several of the largest establishments in the country. Three establishments in Norfolk county, which produced the largest amount of cordage, &c., consumed upward of 6,500,000 pounds of hemp and flax and cotton, and made 6,800,000 pounds of cordage, (including some cotton twine and thread,) valued at \$700,000, of which more than one-half, or \$390,000, was the product of the Day Cordage Company, at Roxbury. It employed a capital of \$200,000 and 183 hands, and wrought up by steam-power 3,000,000 pounds of Manilla, 700,000 pounds of Russian, and 400,000 pounds of American hemp, making 4,400,000 pounds of cordage, valued as above stated, in addition to 170,000 pounds of oakum, worth \$8,000, made from 200,000 pounds of junk. Another establishment, in the same county, made 1,200 tons of cordage, valued at \$300,000. Four factories in Plymouth county consumed upward of 5,500,000 pounds of hemp, and manufactured tarred and other cordage and lines to the value of \$665,242. The largest in the county was the Plymouth Cordage Company, having a capital of \$150,000, which consumed 300 tons of Russian, 250 tons of American, and 11,000 bales of Manilla hemp. It employed 120 spinning jennies and as many male hands and a steam-power of 200 horses, and made 1,800 tons of cordage, valued at \$390,000. The Hingham Cordage Company also made 914 tons of cordage, worth \$153,142, and the New Bedford Cordage Company, in Bristol county, about 1,200 tons of cordage, valued at \$240,000. The Marblehead Cordage Works, in Essex county, made 1,297,300 pounds of cordage from Manilla, Russian, and American hemp, valued at \$110,725. The largest establishment in that county was that of Smith, Dove & Co., at Andover, which manufac-

tured small cordage, twines, and shoe thread, chiefly the latter, to the value of \$213,900, consuming 650 tons of flax and tow.

The total product of Massachusetts embraced a considerable value of cod and mackerel lines, bed cords, clothes-lines, twine, and thread, made from hemp, flax, flax cotton, cotton, and cotton yarn. Cotton twine, &c., is made at the Rochdale mills, in Worcester county; by Whitman & Co., in Hampden county; by several small mills in Essex county; at Walpole and Mansfield, in Norfolk county; and at Swansea, in Bristol county. Much of the value of "cotton cordage," which is extensively used, is, however, included in the returns of cotton manufactures of Massachusetts and other States.

The 3 cordage factories in Maine reported a manufacture of 400 tons of cordage, valued at \$83,500; and 1 in Vermont produced 19 tons, worth \$10,000—included in the latter was the value of some shoe thread made.

The 80 establishments in the middle States represented an aggregate capital of \$1,105,159, and employed 1,144 males and 301 females, whose annual wages cost \$323,744, and consumed raw materials of the value of \$1,644,237. They produced 13,495 tons of cordage, valued at \$2,565,485, or nearly one-third the total product of the Union.

The State of New York was the largest producer, 33 factories in that State, with a capital of \$680,559 and 721 male and 251 female hands, having manufactured 9,600 tons of cordage, valued at \$1,719,094. The cost of material used was \$1,049,734, and of labor, \$211,556.

The principal establishments are those of Brooklyn and Williamsburg, in Kings county, which contained 12 factories, with a capital of \$577,500 and 708 hands, making cordage of the value of \$1,390,196 annually. The establishments of Lawrence, Waterbury & Co., and William Walls' Sons, in Williamsburg, and of Tucker, Cooper & Co., in Brooklyn, are the most extensive, and among the largest in the United States.

One of these manufactories employed a capital of \$250,000, consumed raw material to the value of \$371,500, and made by steam-power, with the labor of 153 male and 43 female hands, 5,656,000 pounds of cordage, valued at \$515,000. It was the largest cordage factory in the United States. Another steam cordage factory of 110 horse-power, employing 90 hands, consumed 12,000 bales of hemp and made 3,240,000 pounds of rope, worth \$270,000. A third factory, with a capital of \$200,000, made from 1,600 tons of Manilla hemp, costing \$210,000, and other materials to the value of \$101,650, 1,600 tons of Manilla and 690 tons of other rope, the former valued at \$256,000 and the latter at \$132,500. Two other rope-works in the county made rope and cordage to the value, respectively, of \$99,708 and \$60,000. There were other large factories at New York, Poughkeepsie, Albany, Troy, Lansingburg, &c.

From Pennsylvania 37 cordage establishments were reported, but their aggregate product was less than one-fourth the value made in New York. The capital invested was \$269,500, and the manual force 241 persons, of whom 9 were females. The cost of material was \$230,167, and of labor, \$62,004 per annum. The product was 2,140 tons of cordage, the value whereof was \$381,901.

The principal manufactories were in Philadelphia, which contained two large and several smaller establishments, making altogether upward of \$250,000 worth of every description of small rope, cordage, twines, spun yarn, &c. The largest establishments were those of Weaver, Fidler & Co., one of the oldest and best equipped in the country, and that of Sproat, McIntyre & Co., (now McIntyre & Schlichter,) each of which had two factories. The former was capable of turning out annually 4,500,000 pounds of rope, or about 7 tons weekly; and the latter, in addition to other materials consumed weekly in the manufacture of small rope, twines, and lines of every kind by patent machinery, about 50 bales of jute hemp, which they were one of the first to employ in making twine for securing the corks in mineral water bottles, and other kinds of twine.

New Jersey numbered 5 cordage factories, with a capital of \$120,000, and employed 136 males and 41 females, producing 1,475 tons of cordage, worth \$396,400. The largest in the State was that of the Elizabethport Cordage Company, which was among the principal establishments in the country.

Maryland had the same number of manufactories as New Jersey. Their combined capital was \$34,900, and the number of hands was 55. They made 280 tons of cordage, valued at \$68,090, of which all but \$1,600 was the product of 4 establishments in Baltimore. Considerable Manilla cordage is made in each of the middle States reported.

Sixty-seven cordage establishments in 7 of the western States produced a larger aggregate value of manufactures, including bale rope, than those of any other section of the Union. Their capitals amounted collectively to \$887,080, and they employed 842 male and 140 female hands, whose wages cost annually \$255,756. The cost of the raw material used was \$2,085,786, and the weight of cordage made 15,206 tons, valued at \$2,700,888, or more than one-third the total value made in the United States.

Missouri, Kentucky, and Ohio were the largest producers of bale rope and other cordage, only 101 tons having been made outside of those States. This manufacture employs about 7 establishments in Cincinnati, making cordage to the value of about \$120,000 annually. Missouri numbered 21 establishments, with capitals aggregating \$398,505, and giving employment to 277 male and 87 female hands, for whose labor was paid annually the sum of \$101,808. The cost of material was \$1,014,010, and the total value of the manufactures was \$1,232,840, which was the value of 7,245 tons of cordage, chiefly bale rope, made in St. Louis, an amount exceeding that of all other States except New York and Massachusetts. Kentucky held the third rank in the Union in the value of cordage returned. It had 16 establishments, and a total capital of \$351,500 employed in the business. The number of hands was 323 males and 44 females, the cost of wages \$88,836, and of material \$963,712, and the product was 6,839 tons, valued at \$1,240,800. In Ohio 22 factories, combining a capital of \$129,475, made, with the labor of 223 hands, 1,021 tons of cordage, worth \$200,103. The total value of 101 tons of rope, &c., made by 8 factories in Indiana, Illinois, Michigan, and Wisconsin, was \$27,145.

From the southern States returns were received of 7 establishments in Virginia, Louisiana, and Tennessee, with an aggregate capital of \$133,500, and employing 81 male and 17 female hands, at an annual cost for wages of \$94,992, and for material of \$211,500. They manufactured 1,620 tons of cordage, which was valued at \$260,650. This was principally the product of Louisiana, in which 3 establishments employed \$123,500 in capital, 56 male and 16 female hands, and produced 1,512 tons of bale rope and cordage worth \$228,500, at a cost for raw material of \$192,000, and for labor of \$88,800. The other States named had each 2 small establishments, producing together 108 tons of cordage, worth \$32,150.

In California 1 large manufactory, with a capital of \$50,000 and 32 male hands, made 800 tons of Manilla cordage exclusively, which was valued in the sum of \$150,000, the cost of material being \$106,000, and of labor, \$18,000. There was also a small establishment in Utah which reported 2 tons, valued at \$3,000.

In the foregoing statistics is embraced a small proportion of cotton cordage, which is now extensively used for ropes and especially for small lines, cords, and twines, but the greater part of the value is included in the products of the cotton manufacture. It is made at several factories in the southern States, and on a larger scale at Norwich, Connecticut, and elsewhere in New England.

#### HISTORY AND STATISTICS.

As long ago as 1620, our early annalists inform us, directions were given by the association under whose auspices Virginia was colonized, for the making of cordage and the growing of hemp and flax, and especially of silk grass, an indigenous plant which had been found, on experiment, to make the best cordage and lines in the world. Ten years previous Sir Thomas Gates directed attention to the value of the native hemp, flax, and silk grass of the country as a material for cordage, and in 1620 each family was required to set out 100 plants of the latter and the governor himself 5,000 plants. It then sold for 6*d.* a pound, hemp being worth in the colony 10 to 22 shillings, flax 22 to 30 shillings, and cordage 20 to 24 shillings per hundred weight.

The encouragement given in colonial and later times to the culture of flax and hemp has been referred to in connexion with manufactures of the former.

Rope-making appears to have been commenced in Boston about 1641, some 12 years after the first culture of hemp in New England. It was undertaken by John Harrison, who came from Salisbury, England, for that purpose, at the suggestion of several gentlemen of the town, and for 20 years or more maintained a large family by his industry. In 1662 John Heyman, of Charlestown, was permitted by the selectmen to make ropes in Boston, but in the following year was ordered to desist from "making fishing-lines, during the pleasure of the town." On further consideration he was prohibited from making ropes, and had liberty to make fishing-lines only, and finally was ordered to take up his posts and depart the town, because he was found to "interfere with Mr. Harrison's income." The business of the latter was also limited by the scarcity and high cost of material.

The making of ropes was then carried on in the open field, and with the rudest appliances. The business, however, steadily increased in Boston, which was the principal commercial port of the country, and in the federal procession in 1788, rope-makers, preceded by William McNeil, numbered 75, and outnumbered any other class of mechanics. Between the hands employed in McNeil's, Gray's, and other ropewalks in the vicinity of Atkinson street occurred the first collision between British soldiers and American citizens, in 1770, which soon ripened into revolution. In 1794, when there were 14 large ropewalks in Boston, (and a company that manufactured twines and fishing-lines considered equal to the Bridgeport lines of England,) seven, in the neighborhood just mentioned, were destroyed at one time by a disastrous fire, the larger ones, at the west end, escaping the conflagration. From that time ropewalks were not allowed to be built within the city, and on the flats west of the common, which were assigned for that purpose, free of rent and taxes, six ropewalks were erected, which were burned in 1806, rebuilt, and again destroyed by fire in 1819. Several ropewalks were also burned at New Boston in 1796, when Boston contained eleven, and Charlestown three lately erected. There were others in the seaports of Massachusetts, which then owned more than one-third of all the shipping of the United States, and more than three times as much as any other State.

Petitions were laid before Congress, in 1808, from 10 manufacturers of twines and lines in Boston, Charlestown, Salem, Beverly, and Plymouth, Massachusetts, asking for an increased duty on those articles, of which they annually made from hemp 46,000 dozen lines and from flax 27,500 pounds of twine.

In Newport, Rhode Island, which, at the Revolution, rivalled Boston in trade, and was much ahead of New York, there were five or more ropewalks in operation in 1769. Much of the hemp and yarn used by the New England rope-makers was imported.

A ropewalk was first erected in New York, in 1718, along Broadway, between Barclay street and Park Place, then a part of the "common." There were a number in that city in 1755, and the business constituted a profitable trade. A covered ropewalk was put in operation at Hudson city previous to 1786, and in 1786 there were 20 in the State, 16 of which, including several in New York, Brooklyn, and Williamsburg, made upwards of half a million dollars' worth of cordage, valued by the marshals at an average of \$400 per ton.

An English traveller makes mention, in 1698, of "several rope-makers having large and curious ropewalks, especially Joseph Wilcox," in Philadelphia, where rope-making in later years became quite an extensive business, deriving support from the commercial pre-eminence of that city. An act of the provincial assembly, in 1730, for continuing encouragement to hemp-growers, imposed penalties for manufacturing unmerchantable hemp into cordage, and added to the parliamentary bounty on hemp three half-pence a pound on that material.

In 1790 there was in operation in Philadelphia complete machinery to sliver, rove, and spin hemp and flax by water-power, not only into strands and yarn for cordage, but also into yarn and thread for coarse linens of 30 cuts to the pound. In June, 1794, George Parkinson, of Pennsylvania, who had previously patented a flax and hemp spinning-machine, recorded the first American patent for the manufacture of cordage, in which he was followed the next year by John Pittman, of Rhode Island,

who took out several patents of that nature. Two years later there were 10 ropewalks in Philadelphia, which manufactured, annually, about 800 tons of hemp. In 1810 there were 15 in the county and 35 in the State, the former making cordage to the value of \$330,113.

Previous to 1803 a ropewalk was erected in Pittsburg by John Irwin, and others within a year or two. In 1836 the first mentioned was run by steam, and made annually, by patent machinery, \$100,000 worth; and another new one had a capacity for \$120,000 worth of cordage annually, being one of the largest in the western country.

Rope-making was commenced in Baltimore early in the last century, by William Lux, a ship-owner, and in 1771 a Mr. Smith had a ropewalk near Bond street. The manufacture of cordage in that place kept pace with the rapid growth of the city, and with the ship-building interests of the State, which, in 1790, built as many vessels as any two of the States of New York, Connecticut, and Rhode Island, and even exceeded New Hampshire. In 1794 Maryland and Virginia had more manufactories of cordage and cables than any two of the States of New Jersey, Connecticut, New York, and New Hampshire, insomuch that Virginia laid a duty of two-thirds of a dollar on imported cordage. Large ropewalks and much shipping &c., were destroyed by Arnold, in 1781, at Warwick, Virginia, and a few years later there were ropewalks at Winchester, in that State, and at Wheeling, on the western waters.

In 1796 James Clamorgan, a merchant of St. Louis, obtained from the Spanish government a grant of nearly half a million acres on the west bank of the Mississippi, below New Madrid, for the purpose of establishing there, by the aid and instruction of Canadian farmers, the culture and preparation of hemp for an extensive manufacture of rope and cordage for his Majesty's navy and for Havana. The hemp culture was not commenced there, however, until after the cession of Louisiana to the United States, in 1803, previous to which a number of small bale rope, bagging, and cordage works had been set up in the western country, particularly in Kentucky. Long before the close of the last century American cordage was preferred by our ship owners to the imported article.

In 1810 the number of ropewalks in the United States, according to the official returns, was 173, exclusive of those in Massachusetts, which was the largest producer, New Hampshire, and East Tennessee, the number in which was not reported. The total value of cables and cordage made was \$4,243,368, of which sum \$1,068,044 was the value of 2,846½ tons made in Massachusetts. Maryland was next in the value of this manufacture, of which \$561,800 was returned as the value of 1,080 tons made in 21 ropewalks in that State. New York and Connecticut each numbered 18 cordage works, the former producing 1,345 tons, worth \$538,000, and the latter a value of \$243,950. Kentucky reported the largest number of ropewalks, and next to Massachusetts, the greatest weight of cordage having 38 factories, producing 1;991½ tons, of which the value was only \$398,400, while 35 ropewalks in Pennsylvania returned 933¼ tons, worth \$357,498. There were 13 ropewalks in Rhode Island, 11 in Maine, 5 in Virginia, 6 in the District of Columbia, (chiefly at Alexandria,) and 2 each in Delaware, North Carolina, West Tennessee, and the Territory of Orleans. Although none were returned from Ohio in that year, the ship-building of the neighboring States supported three large ropewalks at Marietta in 1806, and ten years later there were two large ropewalks at Cincinnati, producing cables and cordage for exportation, and several others at Chillicothe.

The domestic cultivation of hemp had been much increased within a few years by the interruptions to foreign commerce, but the various manufactures of hemp, of which rope-making was the principal, required at that time an annual importation of about 6,200 pounds of foreign hemp. During the year 1,378,944 pounds of hemp and spun yarn, worth, at 15 cents a pound, \$206,000, passed through Pittsburg, to Baltimore and Philadelphia for sale, and in the two months following November 24, 20,784 pounds of bale-rope, 154,000 pounds of rope yarn, 479 pounds of tarred rope, 27,700 yards of bagging, besides tow cloth, thread, &c., were shipped down the Ohio from factories chiefly at Louisville, Lexington, Shelbyville, Frankfort, Danville, and Shippingsport, Kentucky.

Although a number of patents were granted for making cordage, including one in 1808, by Robert Fulton and N. Cutting, of New York, which Fulton had previously patented in England, the manu-

facture of ropes, previous to 1819, was principally done by hand labor, except that in laying up the strands into rope, the twisting was done by horse-power at one end of the walk. In that year and the following Robert Graves, of Boston, took out several patents for improvements in the manufacture of cordage by machinery. Winslow, Lewis & Co., of that city, in 1821, had two ropewalks 1,200 feet long, with this machinery, worked by horse-power, and employing 100 men and boys at a cost of \$32,400. They sold 746 tons of patent cordage for \$18,000. This machinery was adopted in several rope-works in the country, including one in Philadelphia and two large ones in Pittsburg. In 1836 Tiers & Myers, of Philadelphia, the former of whom was also the patentee of machinery for laying ropes and cordage, having purchased the patent right, proceeded to erect large steam works on that principle at Wheeling, Cincinnati, Louisville, and St. Louis, that at Louisville having a capacity to make about \$120,000 worth of patent cordage annually.

The improvement of Graves consisted, in part, in winding the threads upon revolving spools, from which they were conducted through an iron plate perforated with holes, and afterward through a cast-iron tube of a diameter suitable for the size of rope required. In the opinion of officers of the United States navy and others the cordage made by the Graves machinery was stronger than that made by the old method.

In October, 1831, Daniel Treadwell, of Boston, was granted letters patent for a method of spinning hemp and flax, and three years later recorded several other patents for improvements in the spinning and roping of these materials and in the manufacture of cordage. These contributed to the present improved condition of the manufacture.

A new machine for spinning rope yarn for cordage from flax and hemp without previous heckling was introduced in 1833 by Joseph Westerman, of New York. The machinery to spin a ton of hemp per diem, including 4 breakers, 6 finishers, 2 spinning, 3 doubling frames, and a 4-horse power steam-engine, &c., cost about \$9,000. It was claimed that a saving of 8 to 10 per cent. in material was effected by it, and that a ton of hemp could be spun at a cost of \$17 50. A combination among the spinners is said to have prevented its introduction into the large rope-works of Brooklyn and vicinity.

Moses Day, of Roxbury, Massachusetts, in 1836 and 1838, patented machines for spinning rope yarns and twisting the strands, by which a great saving of labor was effected.

A rope-making machine was introduced some 10 or 12 years later, by Slaughter & Perry, of Virginia, which, though not larger than a bale of cotton, received the flax, hemp, or cotton, at a hopper, heckled, roped, twisted and laid the strands, and completed the rope at one operation, at a cost for one inch rope of one cent a pound for making. It was well adapted for making bale-rope, and in 1853 the patent right for Missouri and western Illinois was purchased by the manufacturers of St. Louis at a cost, including machinery to turn out 100 coils of rope and 3 tons of heckled hemp per diem, of \$30,000.

Many other improvements have been made in cordage machinery, in the processes of scutching, lapping, drawing, and spinning the material, among which may be mentioned the scutching cylinders introduced by Mr. Salisbury, of West Troy, New York, and the machines of Mr. Wall, of Bushwick, Long Island. These and the more complicated machinery for twisting and laying the strands have silently revolutionized the manufacture, assimilating its operations to the automatic and labor-saving contrivances of the cotton mill. As a consequence, the business is now chiefly concentrated in a few large establishments, in which machinery, attended mainly by females, performs the principal part of the labor. The character of American cordage has also improved with improved mechanism, and it is now exported to almost every part of the world, including the British Provinces, the East Indies, and even Great Britain. Many of the American improvements have been adopted in Europe, and the machines have been exported to Canada and Great Britain.

Machinists include in a set of improved machinery 1 scutcher, 1 lapper, 2 drawing frames, and 5 jennies, which are estimated to produce, on an average, with the labor of 3 men and 6 girls or boys, 1,250 pounds of No. 20 yarn in 10 hours. One girl can tend 5 bobbins and spin out of good hemp,

which works most easily and is the heaviest, about 1,100 pounds of yarn daily, or 925 pounds of fine yarn, and 750 to 800 pounds of very fine yarn, for which she is paid at the rate of 11 cents per 100 pounds for very fine yarn, and 10 cents for other kinds.

According to the national census of 1840, the manufacture of cordage in the United States, including bale-rope, cotton bagging, &c., employed 388 establishments, with an aggregate capital of \$2,465,557, and 4,464 hands. The value of the product was \$4,078,306. Of the whole number of establishments no less than 111 were in Kentucky, where the value of the manufacture, consisting doubtless in a large degree of bagging and bale-rope, amounted to \$1,023,110. Massachusetts was the second in the extent of the manufacture, having 51 establishments making rope and cordage to the value of \$555,100.

In 1850 the bagging, bale-rope, and cordage factories in the United States numbered 417, and their capital amounted to \$3,341,506. They paid annually for raw materials \$5,612,247, and employed 5,258 male and 799 female hands, at an annual cost for wages of \$1,192,788. The total value of the manufactures was \$8,002,893. Kentucky was still the largest producer, having 159 establishments which made bagging, bale-rope, and cordage to the value of \$2,311,199. New York came next, having produced cordage to the value of \$2,010,850 in 50 establishments; and Massachusetts, in 35 factories, manufactured to the value of \$1,459,968. The two States last named, which are the largest producers of rope and cordage, in 1855 officially reported the following statistics of this branch: Massachusetts had 44 cordage manufactories, having a capital of \$636,400 and 1,000 hands, which made 20,653,418 pounds of cordage, estimated at \$2,478,410 in value, an increase of \$1,572,089 over the same manufacture in 1845. The largest number of establishments (13) were in Essex county, making chiefly lines; but the counties of Plymouth, Norfolk, and Suffolk produced the principal values, the first two exceeding  $6\frac{1}{4}$  million pounds of cordage each. New York in the same year had 29 rope factories, with 872 hands, nearly one-half boys and girls under 18 years of age. The capital invested was \$493,884, value of raw materials used \$1,550,624, and of product \$2,448,798. Seven factories used steam and 2 water-power. Of the whole number, Brooklyn contained 10 factories, which produced, with the labor of 677 hands, the value of \$2,205,153.

In 1861 a novel but by no means a new manufacture of rope was carried on in California by Messrs. Seabert & Shaw, who had a large ropewalk, 1,400 feet long, situated between Nevada and Grass valley, for manufacturing ropes and cordage from raw hides. The process was similar to that employed in making hemp cordage by hand labor, save that the strands were composed of strips of rawhide. The manufacturers sold 2-inch rope at 56 cents a foot,  $1\frac{1}{2}$ -inch at 42 cents, 1-inch at 28 cents, and  $\frac{3}{4}$ -inch at 14 cents a foot. This rawhide cordage was found to be stronger and more flexible than hempen cordage, and worked well in the water.

By the tariff act of 1816 the duty on tarred cables and cordage imported was laid at 3 cents a pound, and on untarred and coir ropes, cordage, yarns, twine, packthread, and seines, at 4 cents, unmanufactured hemp paying \$1 50 per cwt. In 1824 the duty on all kinds of cordage was raised one cent a pound, and that on hemp to \$35 per ton. And in 1828 all cordage was made subject to a duty of  $4\frac{1}{2}$  cents a pound, and dressed hemp to \$3 per cwt.; from which last \$1 per hundred was abated in 1832. In 1842 the duty on tarred cordage was raised to 5 cents a pound, and that on hemp to \$40 per ton, Manilla hemp paying \$25. These rates were changed in 1846 to ad valorem duties of 25 per cent. on cordage of all kinds and Manilla hemp, and to 30 per cent. on other hemp; which duties were further reduced in 1857 to 19 per cent. on the first two articles and to 24 per cent. on hemp. In 1862 Congress again returned to specific duties of  $2\frac{3}{4}$  cents on tarred,  $3\frac{1}{2}$  cents on untarred, and  $2\frac{1}{4}$  cents on Manilla cordage per pound, the raw material to pay the same rates as in 1842. These duties have been since somewhat modified.

The total value of hemp and cordage imported into the United States in the 24 years from 1821 to 1843, inclusive, was \$15,386,693, an average of \$641,111 per annum. From 1838 to 1842 the quantity and value of untarred cordage imported was 2,374,373 pounds, valued at \$113,024; of tarred

## INTRODUCTION.

cordage 7,665,226 pounds, worth \$451,673; of twine and packthread 2,735,733 pounds, valued at \$550,598; and of hemp 41,769,056 pounds, valued at \$2,620,409.

In the fiscal year ending June, 1860, the importations of tarred cables and cordage, chiefly from Russia, amounted to 1,239,750 pounds, valued at \$98,386; and of untarred cordage from Russia, England, Hamburg, &c., to 403,090 pounds, worth \$34,341; and of twine to the value of \$49,238. Of unmanufactured hemp the quantity imported was 45,471 cwt., valued at \$325,846. In the fiscal year 1862 we imported 362,102 pounds of jute and coir yarns, valued at \$32,144; of cables and tarred cordage 362,833 pounds, worth \$28,539; and of other cables and cordage 16,514 pounds, valued at \$656. The weight of Manilla and other hemp from India; of Russia hemp; of jute, sunn hemp, and coir, Sisal grass, and other cordage materials, was 14,838½ tons, valued altogether at \$1,281,377.

Of domestic cables and cordage, the amount exported in 1860 was 26,053 cwt., valued at \$246,572. It was shipped chiefly to Cuba, the British Provinces, South America, and China.

*Statistics of hemp and Manilla cordage produced in the United States during the year ending June 1, 1860.*

**HEMP BAGGING.**

The manufacture of hemp bagging in 1860 employed 34 establishments in 5 States of the Union, having an aggregate capital of \$505,250, and giving employment to 661 male and 126 female hands. They consumed 6,247 tons of hemp, valued with other materials at \$803,800, and the labor expended upon it cost \$141,636. The total product was 9,540,000 yards of bagging, valued at \$1,109,628.

This manufacture was principally carried on in the States of Kentucky and Missouri. The former State contained 26 establishments, with a capital amounting collectively to \$323,050. These consumed annually 3,542 tons of hemp, worth with other materials \$465,500, and employed 512 men and 18 women, whose wages amounted to \$93,372. The quantity of bagging made was 5,750,000 yards, of which the value was \$699,450. Missouri, with 3 establishments and a capital of \$170,000 employed in this business, made from 2,600 tons of hemp 3,680,000 yards of bagging, valued at \$371,578, or considerably more than one-half as much as Kentucky. The cost of material in that State was \$314,000 per annum, and the labor of 125 males and 100 females cost annually \$43,272. Two factories in Tennessee, employing 14 hands, made 70,000 yards, worth \$13,000; and 1 in Alabama, with 12 hands, turned out 40,000 yards, valued at \$6,000. From Wisconsin 2 factories having 6 hands were reported as making bags to the value of \$19,600. The average value of the general product per yard was 11.52 cents; in Kentucky it was 12.16 cents, in Missouri about 10 cents, in Tennessee 18.57 cents, and in Alabama 15 cents a yard.

The manufacture of hempen bagging for packing cotton, generally called cotton bagging, according to the census of 1810, employed 13 establishments in Kentucky, 11 of which produced 453,750 yards, valued at \$159,455. The larger part of this product, or 281,750 yards, including some duck, and worth \$98,612, was made by 5 factories in Fayette county, chiefly in Lexington and vicinity, and 50,000 yards, by 2 mills, at Paris, in Bourbon county. In Georgia 9,463 yards, valued at \$5,032, were made. There were also two manufactories of duck and cotton bagging in West Tennessee, although they were not reported as such; and there was another establishment in Philadelphia, employing 8 looms and capable of making 45,000 yards of bagging annually. In 1826 this article was extensively made, chiefly by negro operatives at Lexington, Paris, Danville, Shelbyville, and other places in Kentucky. A manufactory of cotton bagging, from cotton instead of hemp, was, about the same time, started at Nashville, Tennessee, by a Mr. Allen. The specimens of this new article induced some persons at Huntsville, Alabama, to advertise for 25,000 yards of it; and some planters in Missouri contracted with Mr. Rapp, of Economy, Pennsylvania, for 20,000 yards of the same, at 23 cents a yard, of the usual width. In 1829 the Phoenix mill, at Paterson, New Jersey, was awarded a premium by the American Institute, in New York, for the best article of cotton bagging which was made from Sea Island cotton. In addition to about 400,000 yards of cotton duck made in the place in 1832, the Phoenix Company consumed annually about 600,000 pounds of flax, and made 450,000 yards of duck and 143,000 yards of bagging, which was also made by steam-power at Elizabethtown. In 1830 considerable quantities of cotton bagging were also made from the waste of the cotton mills in Providence and vicinity, which weighed  $1\frac{1}{2}$  pound to the yard, or  $\frac{1}{4}$  pound more than the best hemp bagging. It was strong and stout, and was invoiced to southern markets at 18 cents a yard. A cotton hosiery factory at Newburyport also made about the same time cotton bagging for the southern markets. Cotton bagging, (of hemp) osnaburgs and negro cloths were made by the South Carolina Manufacturing Company, in Darlington district, in 1829, and bagging and twine in Alabama in 1831. Upward of half a million yards of cotton bagging was made in Newport and Covington, Kentucky, in 1836, partly from Russian hemp.

In 1841 a machine for the manufacture of bagging from hemp, which carried the raw material through all the processes of heckling, spinning, and weaving, was in operation at Lexington, Kentucky. It was the invention of Andrew Caldwell, of that city, who claimed to be able to manufacture bagging for 3 cents a yard, saving 5 to 6 cents a yard in the cost over the former modes. It wove at the rate of 30 yards an hour, while other looms would produce only 40 to 50 yards per diem.

In 1844 it was estimated that there were 500 hand-loom in Kentucky engaged in making bagging, each of which produced weekly, on an average, 400 yards, or a total of 10,000,000 yards annually. In Louisville, New Albany, Cincinnati, and Maysville, five power-loom factories produced annually about 3,800,000 yards. In North Alabama and Tennessee, 80 hand-loom made an average of 15,000 yards each, or 1,200,000 yards annually; and 50 hand-loom in Missouri produced 750,000 yards, making a total manufacture of about 15,750,000 yards produced in the West in that year. At an average of 6 yards to each bale of cotton, that quantity was sufficient to bale 2,625,000 bales of cotton, and was in excess of the actual demand. The consumption of hemp was estimated at  $1\frac{1}{2}$  pound to the yard, or a total of 23,625,000 pounds, and the consumption for bale-rope at about as much more, being a total of 21,000 tons, which was 5,500 tons more than Kentucky produced in 1842. One factory at Cincinnati, the Fulton Bagging Company, made about 800,000 yards in the previous year, when the total production of the western States was computed at 10,200,000 yards, at an average cost of about 11 cents a yard.

The price showed a decline of about one-half from the selling price of domestic bagging in 1823-'24, when Kentucky bagging was quoted in New Orleans at 20 to 22 cents, and Scotch bagging, which formed the chief supply, at 22 to 26 cents a yard. Previous to that date, and for many years after, Scotch bagging was annually imported into southern ports to a heavy amount, and often sold at a price exceeding 50 cents a yard, at which it was quoted in New Orleans in March, 1822. Imported bagging was then subject to a duty of 15 per cent. ad valorem. In 1824, when the value of cotton bagging imported amounted to only \$18,491, an effort was made in Congress to raise the duty to 6 cents per square yard, but  $4\frac{1}{2}$  cents was all that could be obtained. In May of the same year it was reduced to  $3\frac{3}{4}$  cents, and in 1832 to  $3\frac{1}{2}$  cents the square yard.

In 1825 the value of the imports of this article amounted to \$637,023, and during the 20 years from 1824 to 1843, inclusive, the value of cotton bagging imported was \$7,561,390, an average of \$378,069 per annum. The quantity imported on an average of the years 1832 and 1833 was 1,112,000 yards. The cotton crop at that time required annually for 1,100,000 bales, at an average of 5 yards per bale, about 4,400,000 yards more than was imported, and at 20 cents a yard the value of that quantity made in this country would have been \$880,000.

On a revision of the tariff in 1842 a duty of 5 cents a pound on this article was proposed, and resisted by the cotton-growers as being equivalent to an annual tax of \$1,422,222 on the cotton interests of the south. The duty was consequently fixed at 4 cents the square yard. A large increase of the domestic manufacture ensued, and in 1846, when the duty was changed to an ad valorem rate of 25 per cent., a Georgia senator stated that good bagging was made in Kentucky more than 5 cents a yard less than it cost in Dundee in 1842, and for 3 or 4 cents a yard less than the price in Scotland in 1846. The price of cotton bagging in 1838 was from 18 to 20 cents per yard, in 1841 from 25 to 27 cents, and in 1846 from  $8\frac{1}{2}$  to  $9\frac{1}{2}$  cents. Bale-rope in the first of those years cost from 7 to 8 cents a pound, in 1841 from 11 to 12 cents, and in 1846 from 3 to 4 cents. In 1852 the quantity imported was 497,301 yards, valued at \$49,347, an average of nearly 10 cents a yard custom-house valuation. In 1857 the duty was reduced to 15 per cent, and in 1862 was laid at  $2\frac{1}{2}$  and 3 cents a pound, according as it cost over or under 10 cents a pound. The number of running yards imported in the fiscal year preceding the late war was only 97,615, valued at \$12,258. The amount of cotton exported in that year would have required, at an average of 6 yards to each bale, 22,374,070 yards, or more than double the quantity returned by the marshals. The amount reported was probably less than the actual manufacture, and a portion was probably included with other linens and cordage, from which it cannot always be accurately separated. For many years past, however, large quantities of gunny bags have been annually imported direct, and some through British ports, from the British East Indies and Australia, which is chiefly used at the south for baling cotton. The value of gunny bags imported in 1858 was \$420,966, and of gunny cloth \$1,016,800. In 1860 the value of the former article imported was \$287,387, and of the latter \$1,795,256; and in 1862 the weight of the two articles imported was

9,780,876 pounds, valued at \$230,404. It was subject, under the act of 1857, to a duty of 15 per cent. ad valorem, which was increased in 1862 to 25 per cent. Some bagging is also made, it is probable, from cotton and the waste of cotton mills both in the manufacturing and cotton-growing States.

*Statistics of hemp bagging produced during the year ending June 1, 1860.*

#### PAPER.

The total number of paper-mills in the United States in 1850 was 443. They employed an aggregate capital of \$7,260,864, and 6,285 hands, of whom 2,950 were females. The annual cost of labor was \$1,497,792, and of raw materials \$5,553,929, and the value of the product was \$10,187,177.

On the 1st of June, 1860, the number of paper manufactories in 24 States was 555. The total amount of their investments was \$14,052,683, and the number of hands was of males 6,519, females 4,392—total, 10,911. The annual expenditure for labor was \$2,767,212, and for materials \$11,602,266. The total value of product was \$21,216,802, which included the values of 131,508,000 pounds of printing paper, 22,268,000 pounds of writing paper, 33,379 tons of wrapping paper, 8,150 tons of straw board, besides 1,944,000 pounds of colored paper, 91,960 pounds of bank-note paper, and 3,097 tons of wall paper—a total weight of 253,778,240 pounds. The average value per pound of the whole quantity was upwards of 8½ cents (8.36). The increase in the value of the product over that of 1850 was 108.2 per cent. The quantity was in the proportion of 8.07 pounds to each person in the Union.

In the New England States the paper-mills numbered 204, which produced nearly one-half of the total value of paper made. Their aggregate capital was \$6,533,460, the number of hands 5,420, (one-half females), and the cost of wages was \$1,375,790, and of materials \$5,907,365 annually. The product was 56,105,300 pounds of printing, 17,298,000 pounds of writing, and 11,600 tons of wrapping paper, 1,568 tons of straw pasteboard, 1,720,000 pounds of colored papers, 67,000 pounds bank-note and 2,147 tons of wall paper, valued altogether at \$10,502,069, an increase of upward of 109 per cent. in ten years. Considerably more than one-half the capital and product was reported by 99 manufactories in Massachusetts, employing 3,339 persons, of whom 1,845 were females, and making paper valued at \$6,170,127, the increase being upward of 137 per cent. It was the value of 27,747,000 pounds of printing paper, 15,598,000 pounds of writing, 6,443 tons of wrapping paper, and 815 tons of straw board, beside colored and wall papers.

In Connecticut there were 55 mills, producing paper of the value of \$2,453,258. The manufactories consisted largely of printing paper, of which 14,581,500 pounds were made, 1,500,000 pounds of writing paper, 2,848 tons of wrapping, 1,000,000 pounds colored, 575 tons of wall paper, and all the bank-note paper made in New England, namely, 67,000 pounds. The principal factories were at Hartford, where there were 21, and at Norwich. The Pacific mills at Windsor Locks, near Hartford, and those of the Chelsea Manufacturing Company, at Norwich, are among the largest establishments of the kind in the world.

In the other New England States the value fell below one million dollars in each. In Maine, which had 14 mills, it amounted to \$990,000, and the manufacture in that State showed the largest rate of increase of all the New England States, viz: 420 per centum. In New Hampshire there were 24 mills and in Vermont 12, and from Rhode Island none were reported.

The middle States contained 273 paper-making establishments, whose aggregate investments in the business amounted to \$5,499,770. The labor was performed by 3,971 persons, including 1,188 females, whose annual wages cost \$950,444, the cost of material being \$4,292,358, and the value of the manufactures \$7,908,437, an increase of 102 per cent. on the product of 1850. The quantity of paper made in these States was 50,604,500 pounds of printing, 4,923,000 pounds of writing, 17,446 tons of wrapping, and 6,582 tons of straw boards, beside miscellaneous articles.

The largest product was returned by 126 mills in New York, containing 1,857 hands, and having a capital of \$2,089,000. They manufactured 17,304,300 pounds of printing paper, 1,772,000 pounds of writing paper, 14,340 tons of wrapping paper, and 2,154 tons of straw board, beside 950 tons of wall paper, valued in all at \$3,059,776, an increase of 87 per cent. Pennsylvania contained 84 paper-mills, having \$1,917,970 in capital and 1,082 hands, who made 18,198,000 pounds of printing, 400,000 pounds of writing paper, 1,503 tons of wrapping, 1,500 tons of straw board, and 24,960 pounds of bank-note paper, the total value of which articles was \$2,367,268, which was an increase of 128 per cent. since 1850. New Jersey had 36 paper manufactories, with an aggregate capital of \$990,000, 715 hands, and produced paper of the value of \$1,582,703, the increase being over 78 per cent. These mills made 8,198,000 tons of printing paper, 2,750,000 tons of writing paper, 668 tons of wrapping, and 2,928 tons of straw board, beside 224,000 pounds of colored papers. They turned out more writing paper and straw board than were made in any other State in the Union. The principal mills are at Trenton, Paterson, and Newark, the Ivanhoe mills, at Paterson, being one of the most complete in the United States. Twenty-five mills in Maryland made paper of the value of \$513,690, and two in Delaware made \$385,000 worth of printing and wrapping papers, the increment in both considerably exceeding 100 per cent.

In the western States there were 53 mills, of which 29 were in Ohio. The total capital employed in paper-making in those States was \$1,386,603, the number of hands was 1,109, of which 362 were females; the annual cost of labor was \$299,436, and of materials \$1,074,178. The product amounted to \$2,041,793, an increase of 104 per cent. It embraced 18,408,000 pounds of printing paper, 48,000 pounds of writing paper, and 3,381 tons of wrapping paper. The writing paper was all made in Ohio, which also produced 12,590,000 pounds of printing paper and 2,500 tons of wrapping, valued altogether at \$1,382,141, the rate of increase being upward of 197 per cent. The 29 mills in Ohio employed a capital of \$875,500 and 724 hands. In Indiana there were 10 mills, in Michigan and Wisconsin five each, in Illinois two, and in Iowa and Kentucky each one mill. In each of the three first named and in Kentucky between one and two million pounds of printing paper, beside wrapping paper, was made, Wisconsin producing the largest amount, or 1,724,000 pounds, and showing also the largest rates of increase in the value. In Kentucky the value of paper made showed a falling off from the product in 1850, and in Iowa, where no paper was made in that year, 170,000 pounds, worth \$17,400, was produced.

The southern States numbered, in 1860, 24 paper-mills, whose aggregate investments were reported at \$572,850. They employed 397 persons, (131 of them females,) the cost of whose labor was \$137,042 per annum, and of material the cost was \$320,365. They manufactured 6,120,200 pounds of printing paper and 952 tons of wrapping paper, valued in all at \$724,503, showing an increase since 1850 in the ratio of 176.5 per cent. In Virginia nine mills made 1,940,000 pounds of printing paper, worth \$270,000. Six mills in North Carolina made 1,495,200 pounds, valued at \$165,703, and four in Georgia produced nearly the same quantity and value. Three mills in South Carolina made 1,085,000 pounds of printing paper, worth \$96,500, and two in Tennessee made 200,000 pounds, worth \$28,000, which was a decrease. From Alabama, which returned a value of \$18,000 in 1850, no return was made. The increase in Georgia and the Carolinas was very large.

A paper-mill in California, (the Pioneer mill, at Taylorsville, in Marin county,) with a capital of \$60,000 and 14 male hands, made 360,000 pounds of printing paper, valued at \$40,000. The cost of material was \$8,000, and of labor \$4,800.

The annual production of paper in the United States is greater than that either of Great Britain or France, and the annual consumption is estimated to exceed that of both countries together. The consumption of rags for paper by 380 paper-mills in Great Britain, in 1854, was about 201,000,000 pounds, (an increase in 20 years of upwards of 100 per cent.) from which were made 177,800,000 pounds of paper, whereof 161,700,000 pounds were consumed and 16,112,000 exported. In France about 235,200,000 pounds of rags were made into 156,300,000 pounds of paper, (assuming  $1\frac{1}{2}$  pound of rags to make one pound of paper,) making in the two countries a total weight of 436,200,000 pounds of rags consumed and of 334,600,000 pounds of paper made, the latter being at the rate of 4.55 pounds per capita for both populations. The consumption of rags in the United States at the same time was assumed to be 405,000,000 pounds annually, and the weight of paper made 270,000,000 pounds, an average of 10.80 pounds of paper per capita.

Although the weight of rags consumed in 1860, calculated at the rate above mentioned, was only 380,667,360 pounds, and the weight of paper made only 253,778,240, or a little over 8 pounds per capita, showing the foregoing estimate for the United States to have been probably too large, there is little doubt that when the actual production, the exportation, and importations of each country are compared, the United States will be found to exceed either in the amount of its annual production, and both in the consumption per capita and in the aggregate. The decrease of paper-mills in England was in consequence of improvements in machinery and the use of steam-power, which in that country and in this has rendered the establishments much more extensive than formerly.

Some of the largest mills in the United States have turned out paper at the rate of seven tons per diem. The materials used are not only cotton and linen rags, the waste of cotton, flax, and hemp mills, and of rope and cordage factories, coir and jute, hemp and other fibres, either crude, fibrilized, or in the shape of worn-out bagging, cable rope, &c., but also straw, hay, and stable refuse, various kinds of wood, particularly bass or white wood, hemlock, &c., corn-husks, mulberry leaves and bark, canes and reeds, &c., &c.

#### HISTORY AND STATISTICS.

The first paper-mill erected within the present limits of the United States was built at Roxborough, near Germantown, Pennsylvania, as early as 1693. This was fifty years after the first introduction of printing in the British colonies, but not more than five or six years after a proclamation was issued by government to establish the first manufactory of white paper in England.

The mill was built and owned by an ancestor of David Rittenhouse, whose family had been long engaged in the manufacture of paper in Holland, and by William Bradford, the first printer in the middle colonies. Printing, writing, and wrapping paper was made there until the mill was carried away by a freshet. In 1728 Mr. Bradford, while a government printer in New York, owned a paper mill at Elizabethtown, New Jersey, which was probably the second one built in the colonies. About the same time, or earlier, a paper-mill was erected on Chester creek, Delaware county, Pennsylvania, by Thomas Wilcox, which afterward supplied the press of Benjamin Franklin with printing paper, and during the Revolution, in addition to writing and printing paper, clothiers' paste-boards, &c., made the bank-note paper used in the old continental paper currency. This was made by the old hand process, which his son Mark continued and improved upon at the Ivy mill until 1827. The mill, after having been in operation a hundred years, gave place in 1829 to another, in which hand-made and bank-note paper has continued to be made to the present time. A paper-mill was early erected at Ephrata, in Lancaster county, Pennsylvania, for the use of a German printing press at that place, and was in operation at the Revolution. The paper manufacture in Pennsylvania and the adjoining provinces was greatly promoted by the enterprise of the Philadelphia printers and booksellers, and particularly by Dr. Franklin. The three provinces of Pennsylvania, New Jersey, and Delaware, in 1769, contained

40 paper-mills, of which 6 were within the present limits of Philadelphia. The value of their manufactures was estimated at \$100,000 annually. After the war, in 1787, Dr. Franklin stated that he had been interested in the establishment of 18 paper-mills, and the number in the States named was then 63, of which 48 were in Pennsylvania. They made yearly about \$250,000 worth of paper. Among these was one at Wilmington, Delaware, owned by Messrs. Gilpin & Fisher, which produced a fine quality of paper. John Carnes, jr., of Delaware, in April, 1793, took out the first American patent for paper-making, which was for an improvement in the moulds. The second was issued in March, 1794, to John Biddis, of Pennsylvania.

During the year 1728 Daniel Henchman, a large bookseller and publisher of Boston, Benjamin Fanueil, Thomas Hancock, and others, obtained permission to erect the first paper-mill in Massachusetts. They were required by the terms of their license to make during the first 15 months 140 reams of brown and 60 reams of printing paper, and at least 500 reams, including 25 reams of writing paper, during each succeeding year thereafter. Samples of their manufacture were furnished the assembly in 1731, and in the following year this first New England mill was the subject of complaint by the paper merchants to the British Board of Trade, who ascertained that it made paper to the value of £200 sterling annually. It was built on the Neponsett river, at Milton, 7 miles from Boston, and, with some interruptions from lack of experienced workmen, continued in operation until the Revolution, or later. In 1796 there were three paper-mills in that town, where the business is still carried on. There were but three mills in the province at the date of the Revolution, and after the peace Andover, Worcester, Sutton, Springfield, and many other places contained paper mills. In 1792 the value of paper made in Massachusetts was estimated at £200,000 annually, and 4 years later the number of mills in the State was 20, of which 7 were on the Charles river and 6 on the Neponsett.

These mills had usually 2 vats each, and employed 10 men and as many boys and girls. Their annual product was about 70,000 reams of wrapping, printing and writing paper, the latter being all laid paper, made by the hand process, no machines, except for grinding the pulp, being then in use. Each mill required a capital of about \$10,000, and was capable of making from two to three thousand reams annually of different kinds of paper. The price of printing paper was from \$3 to \$3 50 per ream at that time. Some of the mills in Pennsylvania were larger, and had 3 or 4 vats each.

In 1765 a large and complete paper-mill was put in operation at Olneysville, near Providence, Rhode Island; and in 1768 the first one in Connecticut was erected at Norwich, by Christopher Lefingwell, who, two years after, was paid by the assembly a bounty of 2*d.* a quire on 4,020 quires of writing paper, and 1 cent each on 10,600 quires of printing paper. A mill was in operation in 1776 at East Hartford, owned by Watson & Ledyard, who, in addition to printing paper for a weekly edition of 8,000 papers by the Hartford press, supplied nearly all the writing paper used in Connecticut and by the continental army.

A paper-mill was erected at Hempstead, Long Island, about 1768, by Henry Onderdonk and Hugh Gaine, a printer of New York, and the business is still carried on at that place. But in 1781 paper was so scarce in the State that the journal of the assembly was not printed. A paper-mill was built at Troy in 1793, by Webster, Ensign & Seymour, who made 5 to 10 reams of paper daily. Previous to that much of the paper used at Albany and vicinity was obtained from a paper-mill at Bennington, Vermont, erected during the Revolution, from which the paper was carried on horseback through the forests. In 1794 Colonel Matthew Lyon put up a paper-mill at Fair Haven, Vermont, for making paper from the bark of the bass-wood, both for wrapping and to supply a printing press owned by him.

One of the earliest paper-mills erected in the south was built at Salem, North Carolina, by the Moravians, who settled there in 1766. During the war the manufacture of paper in that and other States was encouraged by local bounties and other means, and on the return of peace by a loan from the State.

The report of Secretary Hamilton to Congress on the subject of domestic manufacture, in 1791,

classed the manufacture of paper among the branches which had arrived at the greatest maturity, and was most adequate to a national supply.

In 1796 the first paper-mill west of the Alleghanies was put in operation near Redstone Old Fort, (Brownsville,) in Fayette county, Pennsylvania. It was built by Samuel Jackson and Jonathan Sharpless, two Friends, from Delaware, and was long known as the Redstone paper-mill. A paper-mill appears to have been soon after built at Pittsburg, for which the proprietor, Mr. Cramer, in 1800, was able to collect only 260 pounds of rags, but in 1813 collected 70,000 pounds. The business in that town, in 1815, employed 50 hands and produced paper to the value of \$40,000. In the following year the first steam paper-mill in the United States is said to have gone into operation at Pittsburg, with a steam-engine of 16 horse-power and 40 hands, and turned out \$30,000 worth of paper. The first paper-mill within the limits of Ohio was the Ohio paper-mill, built about the year 1805, on Little Beaver creek, in Columbiana county, by John Bowman and others. In 1816 there was a steam paper-mill at Steubenville, producing paper of superior quality, more than sufficient to supply the neighboring counties, and in 1836 was considered the largest in the west. A paper-mill with two vats, at Mount Pleasant, in the same county, was in operation at the former date.

In 1802 the first paper-mill in Berkshire county, Massachusetts, which has ever since been the seat of an extensive paper manufacture, went into operation at Dalton. It has been long known as the "Old Berkshire" mill, and was built by Messrs. Wiswell, Crane & Willard, who during the next five years made about 20 tons of paper annually. Since 1810 it has been owned by David Carson and his sons, who greatly enlarged it in 1855, and made yearly 180 tons of paper, worth 20 cents a pound. The first mill in South Lee, which now makes more paper than any other town in the United States, was begun in 1806, by Samuel Church, on the site of Owen & Hurlbut's mill. About the same date a paper-mill was erected on the north side of the Chicopee, which, about 1825, became the property of David Ames, who introduced improved machinery and became the largest manufacturer of paper in the United States. It was run by his sons, who introduced many improvements in paper-making, until 1853, when it passed into the hands of the Lenox Chicopee Company.

In 1810 the marshals returned 179 paper-mills in 17 States, including one in the District of Columbia, but exclusive of Massachusetts, the number in which was not complete. They reported a manufacture of 425,521 reams, 22,500 rolls, and 428½ tons of paper made, estimated, altogether, at \$1,689,718. Of the whole number, 64 were in Pennsylvania, which made 165,981 reams and 340 tons of paper, worth \$626,749; 28 in New York, of which the product was 77,756 reams, valued at \$233,268, or \$3 per ream; and the mills of Massachusetts made 95,129 reams and 22,500 rolls, worth \$290,951. The value made in Connecticut was \$82,188, and in the four States named it amounted to upwards of three-fourths the total product of the Union. In Pennsylvania, which produced 37 per cent. of the whole, returns were made from 14 counties, of which the principal producers were Delaware, Montgomery, and Berks, having, respectively, 11, 15, and 10 mills each, and Philadelphia county 6 mills, these counties, alone, exceeding the whole number in Massachusetts, which was estimated to be 39, chiefly situated in Middlesex, Norfolk and Worcester.

Eleven of the larger mills in the United States are ascertained to have an aggregate capital of \$200,000, and to produce \$150,000 worth of paper annually.

The consumption of paper was at that time chiefly supplied by the domestic manufacture, of which the product was limited only by the want of material. Rags began about that date to be largely imported for the use of paper-makers, and several attempts were made to utilize other fibrous materials in the paper manufacture. These efforts were stimulated in part by the American Company of book-sellers, who offered, in 1804, gold and silver medals for the greatest quantities and best qualities of printing and wrapping papers made from other materials than cotton and linen rags.

In December, 1801, Joseph Condit, jr., of Newark, New Jersey, recorded a patent for making paper from carriers' shavings, and Burgiss Allison and J. Hawkins, of Burlington, in that State, were the next year granted patents for making paper from corn-husks, which at a later period was employed

by Dr. Jones, of Alabama, and has been the subject of some later patents in this country. Samuel Green, of New London, Connecticut, in 1809, took out a patent for making paper from algae or seaweed, and J. M. Thorndike, of New York, in 1814, for making paper from pelts, and another was issued to E. H. Collier, of Plymouth, Massachusetts, for the use of sea-grass for paper-pulp, in 1828.

Improvements were also attempted in the machinery and various processes of paper-making. Wire-cloth for paper-moulds came into general use in England about the year 1780, but few other important improvements had yet been adopted. The paper was chiefly made of white rags beaten to pulp by tilt-hammers in stone or iron mortars, and the paper was unbleached and uncalendered.

In 1804 Abraham Frost was allowed a patent for preparing tow, &c., for making paper, and Francis Bailey, of Pennsylvania, one, in 1809, for hot-pressing paper. Phares Bernard, of Whitestown, New York, in the latter year, obtained a patent for weaving wire for paper-moulds. In 1816 Jacob Perkins and Thomas Gilpin, of Philadelphia, took out a patent for water-marks in paper, in imitation of those on hand-made paper. During the same month Mr. Gilpin, who had large cotton, woollen, and paper-mills on the Brandywine, took out a patent for an improvement in paper-making, which covered the use of the first cylinder machine made or operated in this country. It was made from published drawings and descriptions of the endless wire machine invented by Louis Robert in 1799, and subsequently improved by Gamble, Donkin and Foudrinier, in England, which had recently come into general use in Europe. It differed considerably from that machine, having been modified by the mechanical ingenuity of the proprietor. In February of the following year Mr. Gilpin sent to Philadelphia paper cut from a continuous sheet, which was used in printing Poulson's Daily Advertiser, a leading journal of the city, and afterward for several valuable publications from the press of M. Carey. Further improvements were made on the machine and the operations of the establishment were greatly enlarged, and employed nearly half a million dollars in capital. The machinery and improvements were all swept off by a flood in 1822. During the year 1817 a quantity of paper, considered superior to any ever before made in the United States, was manufactured by Thomas Amies, of the Dove Paper Mills, in Lower Merion, Montgomery county, Pennsylvania. It was made of the finest linen rags, in sheets 36 by 26 inches, and was valued at \$125 per ream.

The prosperous paper manufacture of the middle States and New England was nearly prostrated by the heavy importations, chiefly of low-priced paper from southern Europe, which followed the peace of 1815. Of 70 paper-mills in full operation in Pennsylvania and Delaware in that year, containing 95 vats, which cost nearly half a million dollars, consuming 2,600 tons of rags, and employing 950 persons, and producing paper to the value of \$800,000 per annum, but 17 vats were at work in October, 1819, and their product was reduced to \$136,000. The number of hands employed was reduced to 175, and the annual wages paid from \$247,000, in 1816, to \$45,000. In the paper hanging and card factories of Philadelphia and vicinity the hands were reduced from 189 to 82, and in the book-printing establishments from 241 to 170. Congress used English paper, although the Messrs. Gilpin offered paper admitted to be equally good at 25 per cent. less cost. The manufacturers of the middle States asked for an increase of the duty on imported paper.

The number of paper-mills in the United States, according to the official census of 1820, was only 108, of which 22 were in Pennsylvania, 21 in New York, 14 in Connecticut, 9 each in Massachusetts and Vermont, 6 in New Hampshire, 5 in Rhode Island, 4 in New Jersey, 3 each in Delaware, Maryland, and Tennessee, 2 in Kentucky, and 1 each in Maine, Ohio, North Carolina, and District of Columbia. They employed 109 vats, of which only 100 were in operation. The value of the product was about \$3,000,000.

About the year 1825 the automaton paper-machine of Foudrinier, imported from England, was introduced into the United States at Springfield, Massachusetts, where the largest manufactory at that time in the United States, that of D. & J. Ames, employed 12 steam-engines and more than 100 females, besides the usual number of male hands, and used machinery patented by them for making continuous sheets, which enabled 1 man to do the work of 30. Four years later there were 6 of

these machines in the State, a proportion of one for every 10 mills, and they had come into use in several other parts of the country. The total value of the paper then made in the United States was estimated at \$6,000,000, of which Massachusetts made \$700,000, using 1,700 tons of rags, junk, &c.

The Foudrinier machines were first manufactured in the United States at Windham, Connecticut, in 1830, by Phelps & Spafford, and soon after at Worcester, Massachusetts, since which time few have been imported. This mechanism, since much improved, and the introduction about the same time of other improvements in preparing and bleaching the pulp, particularly the use of chlorine, greatly facilitated and improved the manufacture of paper and enabled the manufacturers to employ coarse and colored materials, such as calico, worn-out sails, bale-rope and bagging, the refuse of cotton-mills, &c., in making writing and other fine papers which had previously been produced almost exclusively from white cotton and linen rags carefully assorted. The price of paper was accordingly reduced, and a great impulse was given to the manufacture. In 1850 the automatic machinery was used in all but two paper-mills in the United States.

The official returns of the sixth census made the number of paper-mills in the United States in 1840 to be 426, in 20 States and the federal district. The capital invested was \$4,745,239; the number of hands 4,726; and the value of the product was \$5,641,499, exclusive of playing cards and other manufactures of paper valued at \$511,495. Of these, 156 were in the eastern, 237 in the middle, 27 in the western, and 20 in the southern States. The largest production in that year was in Massachusetts, which contained 82 paper-mills, employing 967 persons and a capital of \$1,082,800, and made paper of the value of \$1,659,930. Pennsylvania contained 87 mills, producing a value of \$792,335; New York 77 paper-mills, and a value of \$673,121; and in Connecticut 36 mills made paper to the value of \$596,500.

The value of the paper manufacture of Massachusetts, as reported by the secretary of the Commonwealth in 1845, was \$1,750,273, and in 1855 it was \$4,141,847. The manufacture in the latter year employed 121 manufactories, of which 37 were in Berkshire county and 20 in the single town of Lee. The total capital of the paper-mills of the State was \$2,564,500, the persons employed numbered 2,630, and the product was 17,959 tons and 711,953 reams of paper, valued as above stated. In addition to the foregoing, a mill at Natick, for manufacturing paper pulp, made from 490 tons of stock paper pulp to the value of \$70,475 annually, and a small establishment at Winchenden, with one hand, made 400 reams of sand-paper, worth \$1,200.

The paper manufacture of New York, in the same year, as appears from the State census, employed in 39 counties 109 establishments, 12 of them using steam and 86 water-power, and employing altogether 1,674 persons. They had invested in machinery alone \$664,570, and consumed raw materials, including 6,200 tons of straw and 19,881½ tons of rags, &c., to the value of \$1,511,724. The product included 2,028,595 reams of paper, 3,265 tons of binders' boards, &c., 35 tons of wall-paper, and 87 tons of wrapping paper, together valued at \$2,813,147. That was exclusive of the product of 37 straw-paper manufactories, five of them using steam-power and employing 252 hands, and consuming 8,120 tons of straw, valued, with lime, fuel, oil, &c., at \$76,611. They made 2,213 tons of board and 769,160 reams of paper, of the total value of \$250,564.

At different times since 1756 attempts have been made in Europe to manufacture paper from Straw. As early as the year 1800 Matthias Koops is said to have first made, in England, from old waste written and printed papers, which had always been thrown away as useless, 700 reams, weekly, of good white paper. At the same time he is said to have made from straw, wood, and other vegetable fibres, without the addition of any other stock, a better quality of paper than had been produced previously. He obtained a patent for the use of straw, hay, thistles, &c., and the waste and refuse of hemp and flax, as materials for paper. Tolerably white and durable paper was made from pure straw by Huygeron, a Frenchman, who obtained a patent for the process in that country in 1820, and another for the same purpose was obtained by Louis Lambert in 1824.

In the United States the first patent for preparing straw, hay, &c., for paper, by the use of lime

or an alkali to act on the siliceous cuticle, was recorded by William Magaw, of Meadville, Pennsylvania, in May, 1828, and was reissued to him in 1830. He communicated his discovery, accidentally made, to Mr. John Shryock, proprietor of a paper-mill at Chambersburg, by whom and his son, G. A. Shryock, the manufacture was first undertaken in this or probably any other country, at least on a commercial scale, with the aid of a cylinder machine adapted to the new material. Mr. Shryock made paper from straw and blue-grass, &c., at the rate of 300 reams per diem by water-power, and for a number of years continued the manufacture with such success as to attract attention in America and Europe. The article was also made about the same time under the authority of Mr. Magaw, at Philadelphia, by Aaron Denman, and also at Baltimore. The product was chiefly wrapping paper, which, though coarse and brittle, was in great demand at Philadelphia and elsewhere, and mills were afterward commenced in other places until the use of that material became quite extensive. A very good quality of paper is made of straw and other materials combined.

Improvements were made in the manufacture of straw paper in England, where it is largely used by the newspaper press, and also in France. A work published in 1838, by M. Piette, chiefly relating to the use of straw as a material for paper, was accompanied by samples of paper from that and other fibrous materials mixed or unmixed, showing that superior paper could be produced from straw, wood, &c. In the United States, white paper was first made to any extent from straw by the Messrs Ames, of Springfield, Massachusetts, about the year 1849. Within the last 12 or 15 years many improvements have been made, and several newspapers of large circulation have employed it for several years. Among the earliest of these was the Public Ledger, of Philadelphia, which, in its daily and weekly issues, has annually consumed upwards of 50,000 reams, chiefly made at Manayunk, near that city. The use of caustic alkali, and boiling at a high heat in closed boilers, for preparing straw for paper, was patented in France by Coupier and Mellier, who exhibited it at the World's Fair, in New York, in 1853, and in 1857 took out a patent for their process in this country. This method of treating straw was improved by C. S. Buchanan, of Saratoga county, New York, who boiled the straw under high pressure in closed boilers, thereby so disintegrating the fibre that paper of greater whiteness, softness, and strength was obtained. The use of rotary boilers, first used in this country at Paterson, New Jersey, by H. V. Butler & Co., for preparing paper pulp on a large scale from cotton waste, bale-rope, bagging, &c., has still further contributed to improve the quality of straw paper. These and other improvements have been carried into extensive use at the Niagara Paper-mills in the State of New York, which now supply large quantities for the New York Tribune. M. Kelin, of Belgium, in 1854, introduced a treatment, analogous to that of water-rotting of hemp, for converting straw into paper pulp; but whatever process is used, the cost of reducing the raw material to pulp in a great degree offsets the cheapness of the crude material.

In August, 1838, Homer Holland, of Westfield, Massachusetts, took out a patent for preparing the husks of Indian corn for paper-making, a material which is said to have been earlier used in a mill near Rimini, in Italy, and was also unsuccessfully tried by Schaeffer. An Austrian patent for making paper from corn-husks is now owned in the United States, and the experiments have been so successful that preparations on a large scale have been made to manufacture printing and other papers from it, among others, by the Clinton paper-mills, at Steubenville, Ohio.

In 1830 a patent was taken out by two citizens of Meadville, Pennsylvania, for making paper from wood, at the rate of 5 to 7 reams from 100 pounds of wood. Paper has been successfully made from the bass or white wood and from that of the hemlock tree. The Ligneous Paper Company erected several years ago a large mill at Little Falls, New York, for making paper from bass wood alone. The cane or reed of the southern swamps has been used for paper pulp by a mill near Baltimore, and before the rebellion a mill was erected at Wilmington, North Carolina, to prepare that material on a large scale for paper-machines. The southern States contain vast quantities of fibrous materials suitable for paper which have never yet been turned to account.

The recent improvements in machinery and in the chemical processes for preparing flax, hemp,

and similar fibres, as textile materials, under the names of flax-cotton, fibrilia, cottonized hemp, &c., promise to become a source of abundant materials from hitherto unutilized vegetable fibres. The number of different fibrous plants and articles which have at one time and another been used as materials for paper exceeds one hundred.

Improvements have also been made in the Dutch engine for preparing the pulp from rags, which superseded the old mortar, and is still used with the patented improvements of Joseph Kingsland, of New Jersey, which have been adopted in this country and in England.

Several mills in New England and New York produce chiefly wall-papers, to be printed as paper-hangings.

For the encouragement of the paper manufacture, Congress in 1789 imposed a duty of  $7\frac{1}{2}$  per cent. on foreign paper imported into the United States. In 1816 the duty was increased to 30 per cent., and in 1828 was changed to a specific rate of 10 to 20 cents a pound on the different kinds of paper. In 1842 the duty was reduced somewhat on the better qualities, and in 1846 was again laid at 30 per cent. ad valorem. In 1857 it was again reduced to 24 per cent., but was raised in 1862 to 30 per cent.

Rags have been generally admitted as raw material, free of duty.

The value of rags imported in 1833 was \$411,785, and of paper only \$63,083. In 1846 the importations of rags from all countries into the United States amounted to 9,897,706 pounds, valued at \$385,020, an average of less than 4 cents a pound. Of that quantity 8,002,865 pounds were obtained from Italy which has continued to furnish from one-half to three-fourths of all the rags imported. In the 10 years from 1846 to 1855, inclusive, the total weight of rags imported was 209,833,718 pounds, of which 148,300,155 pounds came from Italy, the whole valued at \$7,328,721. The annual average from all countries in that time was 20,988,371 pounds, valued at \$732,872, and from Italy the annual weight received was 14,830,015 pounds. In the year ending June 30, 1862, the importation of cotton and linen rags amounted to 9,067,449 pounds, valued at \$241,738, of which 1,499,746 pounds, worth \$35,785, came from Canada and the British Provinces.

The quantity of paper, exclusive of paper-hangings, playing-cards, &c., imported in the fiscal year 1834-'35, was 522,468 pounds, valued at \$103,862; and the value of paper and stationery of domestic manufacture exported in the same year was \$69,700. The value of paper-hangings imported in that year was \$93,634. In 1856 the value of writing and printing paper imported amounted to \$272,010; of paper-hangings, to \$228,577; of playing-cards, \$10,577; sheathing paper, \$5,530; various manufactures of paper, \$135,167; paper and fancy boxes, \$36,700; blank books, \$12,940; papier-mache articles, \$25,051; total, \$726,552. In the year ending June 30, 1862, the value of writing paper, paper-hangings, and other manufactures of paper imported, was \$179,684. The exports of domestic paper and stationery in that year amounted to \$399,793, chiefly to Canada and the British Provinces, the Spanish West Indies, and South America, and including the value of \$16,053 exported to Great Britain, which amount in the next fiscal year was increased to \$29,979.

#### PAPER-HANGINGS.

This branch of decorative art employs 26 establishments in 2 of the eastern and 3 middle States, more than one-half the value being made in New York. The aggregate capital was \$1,037,600, the number of hands 1,203 males and 91 females, whose wages cost annually \$328,224. The cost of materials was \$1,153,670, and the value of the product \$2,148,800.

Returns were made by 6 mills in New England, of which 4 were in Massachusetts and 2 in Connecticut, employing, respectively, 54 and 31 hands, and producing, the former a value of \$89,500, and the latter of \$52,700.

The manufacturers of wall-paper in New York numbered 9, which employed an aggregate capital of \$465,000 and 682 persons, whose wages amounted yearly to \$173,760. The consumption of materials cost \$661,250, and the product was valued at \$1,181,000. Seven manufacturers in New Jersey

made paper-hangings of the value of \$390,600, and gave employment to 228 persons, 36 of them females. Four mills in Pennsylvania returned a total capital of \$310,000 and 299 male and female hands, who manufactured a value of \$435,000, including some of the finest qualities made in the country.

These statistics show a very large increase in the business since 1850, when there were only 6 mills, with a total capital of \$49,500 and 93 hands, producing paper-hangings of the value of \$107,040, at a cost for labor of \$25,872, and for material of \$52,335.

The printing in these establishments is done both by blocks and by cylinder machines, and the manufacture has been so much improved that the better qualities of the domestic article rival the French and English papers, and the designs are generally original. They embrace nearly every variety of paper-hangings, including plain, velvet, satin-faced, flocked, and gilt patterns.

As an article of decorative furniture paper-hangings were first offered for sale in America about the year 1737, but, except occasionally in the houses of very wealthy persons, were little used before the middle of the last century. Their manufacture on a limited scale was commenced as early as 1763. In 1787 there were several manufacturers of wall-papers in Boston, in New Jersey, and in Pennsylvania. Two years after, John Carnes, of Delaware, who subsequently took out the first American patent for paper-moulds, and was for some time American consul at Lyons, associated himself with Burrell Carnes and two Frenchmen, under the firm name of Le Collay & Chardon, and commenced the manufacture of paper-hangings in Philadelphia, producing in the first 9 months 10,000 pieces of a common quality of unglazed paper. William Poyntell soon after engaged in the same business, which by the Secretary of the Treasury, in his report to Congress in 1791, was declared to have made considerable progress in the United States. Boston in 1794 produced yearly 24 000 pieces, and exported wall-papers to other States. In 1810 there were 4 paper-hanging establishments in Philadelphia and vicinity which stamped annually 140,000 pieces of paper, valued at \$97,417; and in Providence, Rhode Island, 8,000 pieces, valued at as many dollars, were produced. Within the next 10 years paper-hangings were made in Philadelphia by Beck & Stewart, H. G. Borrekens, John Carson, T. M. Longstreih, John Van Meter, John B. Howell, and others. It was commenced at East Hartford and Killingly, Connecticut, and at Albany, New York, and elsewhere.

During the war of 1812 superior styles from French designs were attempted, and about 1824 glazed grounds were introduced. Hezekiah Steele, of Hudson, New York, in 1813, took out a patent for making paper-hangings with satin grounds. In 1822 Peter Force, of Washington, recorded an improvement in the printing of paper-hangings. The introduction here soon after of the Foudrinier machine, which was first brought into use for producing long rolls of paper for paper-hangings, was the principal improvement made in the early manufacture. The rolls for this purpose are usually 1,200 yards in length and from 20 to 40 inches in width, and cost before the war from 9 to 14 cents per pound, or 11 cents on the average.

One of the largest establishments in the United States, and exceeded in extent before the rebellion by few in the world, was that of Howell Brothers, established at Philadelphia in 1813, and has turned out as much as 5,000 tons of wall-paper per annum, with the labor of 200 hands. The cheaper and more common qualities are printed by machinery, the patterns being engraved on cylinders, as in ordinary calico printing. The finer descriptions are printed by the old hand process. The initial operation of chalking the blank roll, which, as well as many other processes, were not long since done by hand in England, have in the largest American establishments been effected by steam. Machinery consisting of a series of cylinders driven by steam is also used in the subsequent processes of polishing and glazing.

Curtain papers, printed in the piece, in patterns of suitable size and design to be cut off for window shades, in place of roller-blinds of linen or muslin, and for screens, &c., are in extensive demand, and form a considerable item in retail sales.

The Philadelphia and New England schools of design for women, and other institutions of the

# INTRODUCTION.

CXXXI

kind, now furnish the domestic manufacturers with many original designs for paper-hangings, and the taste in this article, which is one of very large consumption, has been much improved within a few years.

The value of paper-hangings imported in 1834-'35 was \$93,634; in 1837-'38, \$3,390; in 1850, \$76,820; in 1852, \$113,164; and in 1862 amounted to only \$8,874. It was chiefly from France and Great Britain.

The duty on paper-hangings was laid in 1816 at 30 per cent. ad valorem. In 1824 the duty was increased to 40 per cent, but in 1842 was reduced to 35, and in 1846 to 20, and again in 1857 to 15 per cent. ad valorem, from which it was raised in 1862 to 30 per cent, and since that to a still higher rate.

**PRINTING.**

The number of printers and publishers in 25 States and Territories, exclusive of lithographic and copper-plate printers, in 1850, was 673, and they employed capitals amounting in the aggregate to \$5,862,715. The number of employes was 8,268, of whom 1,279 were females, the annual cost of whose wages amounted to \$2,737,308, and the cost of raw materials was \$4,964,225. The value of the product was \$11,586,549.

On the 1st of June, 1860, the book, job, and newspaper establishments, returned from 36 States and Territories, numbered 1,666. They employed an aggregate capital of \$19,622,318, and 20,159 persons, including 2,333 females, at an annual cost of \$7,588,096, and paid for materials the sum of \$12,844,288. The total value of the product was \$31,063,898, an increase of \$19,477,349, or 168 per cent. over the value of the same industry in 1850. The increase in this branch of domestic manufactures is unprecedented in our previous history. The value of the printing done, though in the aggregate far short of the real value both on account of the incompleteness of the returns, from some States, especially in regard to the newspapers printed, and also because the profits accruing in the hands of the bookseller, are in most cases not included in the total value, was, nevertheless, in the proportion of nearly one dollar to each individual in the Union.

Of the whole number of printing-houses the New England States returned 278, having an aggregate capital of \$2,602,400, and giving employment to 3,013 persons, 453 of them females, who received as wages annually \$1,139,870, the raw materials costing \$2,027,148, and the value of the work done amounting to \$4,421,401, an increase of upward of 96 per cent. in ten years.

Of the establishments in these States Massachusetts contained 150, against 112 in 1850; Maine, 38; New Hampshire, 30; Connecticut, 28; Vermont, 18; and Rhode Island, 14.

The business in Massachusetts employed a capital of \$1,755,200 and 1,772 hands, and yielded a product of \$2,989,416, an increase of 96 per cent. Of that amount 23 book and job printing establishments (three of them book publishing alone) in Boston produced a value of \$699,522, and 77 newspaper establishments in the same city a value of \$1,703,280.

Connecticut, with the labor of 522 hands, turned out an annual value of \$675,528, the increment being in the ratio of 16 per cent.; and Maine produced the value of \$261,874, an increase of 119 per cent.

The five middle States and District of Columbia numbered 708 printing offices, employing \$13,056,750 in capital and 11,850 hands, including 1,461 females, and paid for wages \$4,355,856, and for material \$8,585,413 annually. The value of printing done was \$20,260,906, an increase over the product of 1850 of \$11,789,274, or 139 per cent. in the value and of 365 in the number of establish-

ments. The value of the industry in that section amounted to 65.2 per cent. of the aggregate for the United States, and that of New York and Pennsylvania together to 60 per cent. of the whole. The value produced in those States was \$18,639,982, and in the other middle States and federal district to \$1,630,924. The value of the manufacture in New York alone reached the sum of \$12,617,105, which was upward of 40 per cent. of the total product of the Union, and exceeded the total value of printing in all the States in 1850 by \$1,030,951, being 104.6 per cent. in excess of its own product in that year. The number of printing-houses in that State was 349, an increase of 149; and their collective capital amounted to \$7,880,550, the cost of materials annually to \$5,867,458, and of labor to \$2,603,116, the last value being the cost of the labor of 6,207 males and 1,011 females employed. Of the total value of printing returned from that State, \$10,438,155 was the product of 149 establishments in the city of New York, in which there were 51 newspaper establishments with a total capital of \$2,941,200 and 2,486 hands, which printed newspapers and periodicals annually to the value of \$6,182,946. Seventeen book publishing houses, with capitals amounting to \$3,121,000 and 2,153 hands, printed books of the annual value of \$3,225,551, and 81 book and job printing offices, with \$645,800 in capital and 871 hands, produced work valued at \$1,033,658. The value of the business in the second ward of that city amounted to \$5,355,641, and included 134,116,800 copies of newspapers, valued at \$3,574,493; \$932,590 worth of books published, and \$848,558 worth of book and job printing. One establishment issued 31,805,000 copies of newspapers, valued with advertisements at \$800,000 per annum, and consumed 78,000 reams of paper, worth \$400,000; another house in the same ward published 20,000,000 copies of newspapers; a third, 18,200,000 copies; and a fourth, 16,443,000 copies. The value of the printing done in the fourth ward of the city was \$2,900,613, of which \$2,143,613 was the value of daily, weekly, and other newspapers and periodicals, and \$500,000 the value of 3,000,000 copies of books published by one house. The number of newspapers was 80,841,960 copies, of which 28,600,000 were from the "Tribune" office, and 16,000,000 from that of the "Stats Zeitung." The number of magazines was 2,700,000, of which 1,500,000 were from one establishment. The value of printing done by four establishments in Albany county was \$470,000, and Erie and Monroe each exceeded a value of \$270,000 annually.

The number of establishments in Pennsylvania was 267, an increase of 165. They aggregated a capital of \$4,137,850, employed materials of the value of \$2,122,635, and paid for the annual labor of 3,087 male and 315 female hands \$1,214,768. The value of the book, job, and newspaper printing done in the State amounted to \$6,022,877, chiefly done in Philadelphia and Pittsburg. It was an increase of \$4,305,265 in 10 years, or 250 per centum. Book printing was executed by 42 establishments to the value of \$2,377,400, annually employing a capital of \$2,191,500 and 816 hands. Sixty-seven job printing-houses, having invested \$589,600 and employing 739 hands, executed work valued at \$1,084,225; and 158 newspaper establishments, with capitals amounting altogether to \$1,356,750 and 1,847 hands, printed newspapers annually to the value of \$2,561,252. Of the total value upward of \$5,000,000 was produced by 31 newspaper offices, about 40 book-publishing houses, and a large proportion of the job offices in Philadelphia.

Sixteen newspaper establishments in Alleghany county (chiefly in Pittsburg) employed in capital \$248,400 and 326 hands, and printed newspapers of the value of \$538,103 annually.

In New Jersey 59 printing establishments employed a capital of \$215,400 and 844 persons, producing work of the value of \$303,669, which was a large increase upon the returns of 1850. From Delaware, which made no return in 1850, a value of \$105,332 was returned by 7 establishments, and 26 in Maryland reported printing done of the annual value of \$433,423. Eight establishments in the District of Columbia, having a capital employed of \$471,250 and 495 hands, produced printed work in the value of \$778,500, (chiefly government printing,) an increase of 322 per cent.

Eleven western States and Territories contained 487 printing establishments, possessing a capital of \$2,595,569, and employing, at a total cost of \$1,393,922, 3,646 male and 366 female hands. They expended for materials \$1,732,712, and the value of the printing done was \$4,546,281, against a value

of \$676,186 reported in 1850, the ratio of increase exceeding 572 per centum. The largest amount of printing was done in Ohio, which numbered 141 printing establishments, with a collective capital of \$1,224,374 and 1,813 hands, which produced work of the annual value of \$2,227,264, an increase of nearly 523 per cent. About \$1,503,000 was the product of 32 printing-houses in Cincinnati, which employed a capital of \$689,000 and 1,043 persons; and 10 printing establishments in Cleveland executed about the value of a quarter million dollars.

Illinois was next to Ohio in the number and extent of its printing establishments, of which there were in the State 84, with capitals amounting to \$487,200, and producing a value of \$825,905, against \$18,475 returned in 1850. The city of Chicago contained 19 of the whole number in the State, and the value of the work executed there was \$525,000.

In each of the other western States the increase was large. Returns were received in 1860, for the first time, from 13 printing establishments in Minnesota, which executed work of the value of \$31,835; from 2 houses in Kansas, where work was valued at \$4,630; and from 5 in Nebraska, where the product amounted to \$24,675.

From 11 southern States returns were made of 151 establishments, having collectively a capital of \$1,161,799 and 1,014 hands, whose wages cost \$417,912. The materials used cost \$308,431, and the value of the printing done was \$1,253,154, an increase of \$1,080,149 over the returns of that section in 1850. The largest product was in Tennessee, where 21 printing offices executed work valued at \$443,120. Georgia and Texas each contained the same number of printing-houses as Tennessee, and the values returned by them respectively were \$267,974 and \$142,520. Virginia and Alabama each numbered 22 printing establishments, and the value of work done in the former was \$102,959, and in the latter \$63,100. No report of printing done in North Carolina, Florida, Texas, and Mississippi in 1850. In 1860 the first contained 13 establishments, producing a value of \$87,950; South Carolina, a value of \$15,295, by 5 establishments; Florida, \$2,000 in 1 shop; and Mississippi, a value of \$63,890, executed by 11 offices; while 6 in Arkansas produced a value of \$16,650.

The Pacific States since 1850 have brought into operation 42 printing establishments, with a total capital of \$205,800 and 270 male hands, who received in wages \$280,536, the materials consumed costing \$140,584. The value of the work executed was \$582,156. Of these establishments California reported 31, Oregon 9, and Utah 2; the first employing 219 hands, the second 31, and the last 20; and they produced, respectively, the following values, in newspaper, book, and job printing, viz: California, \$485,954; Oregon, \$60,202; Utah, \$36,000.

The growth of this great American industry which has received such extraordinary development in the last decade, and now employs a capital of nearly twelve millions of dollars and more than twenty thousand operatives, and in several of its branches exceeds in extent the same industry in any other country, has corresponded in time and measure with the rapid increase of population and of the wealth and intelligence of the country since its first implanting. The activity of the press has been at once the index and the instrument of progress in civilization and that mental activity which has contributed to the present position of the nation in its moral, social, and material interests.

Printing was first executed in the American colonies, at Cambridge, in Massachusetts, by a printer named Daye, who, in January, 1639, printed the "Freeman's Oath," on a press shipped the previous year from England, by Rev. Mr. Glover. The first issue in book form from the colonial press was the "Bay Psalm Book," printed by the same person, in 1640, a crown octavo of 300 pages, of which a second edition was printed in 1647. In addition to a yearly almanac, a volume of colonial laws printed in 1641, several other unimportant works were printed by Daye, down to 1649, when Samuel Green, an early emigrant and the ancestor of several pioneer printers in different towns, succeeded him in charge of the Cambridge press.

A second press, designed for printing Eliot's Indian Bible, was sent from England in 1655 and set up in the same building with the first one, where all the printing done in the colonies for nearly forty years was executed, amounting to little more than an average of one publication annually. A second

and more skilful printer, Marmaduke Johnson, was added to the establishment in 1660. The most important work printed in the years referred to was the Indian Bible, in quarto, on fine post paper costing six shillings per ream, the presswork costing, when done by Green alone, £3 10s. per sheet, and when assisted by Johnson, £2 10s. per sheet.

In 1672 the first privilege in the nature of copy-right was granted to John Usher, one of the earliest booksellers of Boston, for a revised edition of the Laws of the Colony. In 1674 the first press in Boston was established by John Foster, by permission of the General Court, which ten years before had restricted the privilege of printing to Cambridge only. Foster's first book was issued about 1676, his printers being James Glen and Samuel Green, jr., a son of the Cambridge printer. Foster was succeeded in 1681 by Mr. Sewall, and in 1684 Richard Pierce commenced printing in Boston, where, on the 25th of September, 1690, he published the first newspaper sheet ever printed in America. It was designed to appear once a month or oftener, but was immediately suppressed by the General Court. In April, 1704, appeared the first number of the "Boston News Letter," the first successful newspaper in America, a weekly publication, issued "by authority," by John Campbell, postmaster, and printed by Bartholomew Green, another son of the Cambridge printer, who had set up business in Boston in 1690, and in 1722 became the proprietor of the News Letter, which, during the first 15 years of its existence, was the only periodical in America. The Boston Gazette, issued December 21, 1719, was the second.

The next province in which a printing press was erected was Pennsylvania, by William Bradford, in 1686, four years after the first English settlement was made at Philadelphia.

At Kensington, in that city, Bradford printed, the same year, a small quarto tract, of which a copy is extant. And soon after printed "Leeds Almanac," for Samuel Alkins, followed by other ephemeral and controversial tracts on religious and political subjects, which, with a few books of statistics, Bibles, and psalm books, formed the staple of the early publications throughout the colonies. Becoming involved in litigation with his Quaker brethren in authority because of some polemical publications from his press, Bradford in 1693 removed to New York, and set up the first press in that province, where for 30 years he was public printer for the States of New York and New Jersey, enjoying from the former a stipend of £50 per annum. During the same period he was part owner of the first paper-mill in this country, on the Wissahickon, near Philadelphia, and of another at Elizabethtown, New Jersey, where he resided. After his removal from Philadelphia, his press in that place was managed by one Jansen until 1712, when Andrew S. Bradford, a son of the original proprietor, resumed control of it, and continued to be the principal or only printer in Philadelphia until 1723, when S. Keimer, an English printer, established the second press in that place, employing as a workman young Benjamin Franklin, the most illustrious of American typographers. In December, 1719, Andrew Bradford issued the "American Weekly Mercury," which was the third newspaper in the colonies, and was followed in 1725 by the New York Gazette, published by the elder Bradford in New York. A press was established at Albany in 1771, but was stopped by the Revolution in 1776.

The next State in which printing was executed was Connecticut, where Thomas Short commenced printing at New London in 1709, and was succeeded by Timothy Green, a son of Samuel Green, jr., of Boston, who printed for the colony at a salary of £50 per annum. A newspaper was started in Connecticut, at New Haven, in 1755, by James Parker & Co.; and the first press at Hartford was set up in 1764 by a grandson of Timothy Green, who commenced the Connecticut Courant, the third paper in that colony.

A press was erected at Annapolis, Maryland, in 1726, by William Parks, who executed the printing for the government, which had been previously done by Andrew Bradford, at Philadelphia, and was followed in that office by Jonas Green, from New London, Connecticut, whose salary was £500 currency. The first press at Baltimore was erected by N. Hasselboot, who had learned the art of Christopher Sower, of Germantown, Pennsylvania. The first newspaper in that town and the third in

the province was the *Maryland Journal* or *Baltimore Advertiser*, begun in August, 1773, by William Goddard, who had been the first printer at Providence, Rhode Island.

In 1729 a press was also established at Williamsburg, Virginia, by Mr. Parks, the Maryland printer, who printed the same year Steth's *History of Virginia* and the *Colonial Laws*; and in 1736 commenced the *Virginia Gazette*, the first newspaper in the province.

A press was set up at Charleston, South Carolina, in 1730, by E. Phillips, of Boston, who, with three other printers, is said to have been tempted thither by a reward of £1,000 offered to any printer who would settle in the province. He died soon after, and his successor, Thomas Whitmarsh, in 1731 or 1732, issued the *South Carolina Gazette*, the first paper in the Carolinas. Lewis Timothee, from Philadelphia, succeeded Whitmarsh, who died in 1733.

The first press in Rhode Island was that of James Franklin, the brother of Benjamin, at Newport, where, in 1732, he commenced the publication of the *Rhode Island Gazette*. He died in 1735, and his press, brought by him from England, where he had learned the art, and first employed in Boston on the *Boston Gazette*, and afterward on the *New England Courant*, the third paper in Massachusetts, was managed by his widow and daughters, and after 1752 by his son James, who, six years later, established the *Newport Mercury*, in the office of which it remained until a recent period. This press, which has acquired celebrity as the one on which Benjamin Franklin learned the printer's art in the office of his brother, is now preserved in the Patent Office at Washington, and is interesting as a type of the old lever hand-press nearly in its rude and primitive form, as it was invented in 1450, requiring two men to work it, and capable of turning off 200 or 250 copies (printed on one side) per hour.

In 1762 William Goddard established the first press at Providence, where he commenced the *Providence Gazette* and *Country Journal*. Like the press of Franklin, at Newport, and some earlier and later ones, this was also for some time managed by the females of the proprietor's family.

The first press owned in New Jersey was that of James Parker, at Woodbridge, established in 1751, and removed to Burlington in 1765, where Keimer & Franklin had occasionally done government work, and where he printed Smith's history of that province, after which he returned to Woodbridge.

Daniel Fowle, of Boston, established the first printing press in New Hampshire, at Portsmouth, in 1756, and the same year issued the *New Hampshire Gazette*.

At Newbern, North Carolina, printing was commenced about 1755 by James Davis, who published in December of that year the *North Carolina Gazette*. There was another in the province before the Revolution.

In Delaware, a press was first set up at Wilmington, by James Adams, who did the government printing, previously executed at Philadelphia, where Adams had a press. He proposed to publish the *Wilmington Courant*, and was the only printer in that province before 1775.

The public printing of Georgia was done at Charleston until 1762, when James Johnson, a Scotchman, established a press at Savannah, for which he was liberally rewarded. He commenced the *Georgia Gazette* in 1763.

In 1778 J. P. Spencer and Timothy Green, two printers of Norwich, erected a printing press at Hanover, then claimed to be in Vermont, where they commenced a newspaper, which was removed the same year to Westminster, at the request of the newly organized government of the State, which was the first of the new States to receive the art. In 1781 they published the *Vermont Gazette* or *Green Mountain Postboy*, but in 1783 the press was removed to Windsor, under new management.

Printing was first executed within the present boundaries of Maine as early as 1780, and in 1810 six towns now in that State published newspapers, including Portland, which had three.

The introduction of this important art in the remaining States and Territories may be more briefly stated as follows:

The first press established west of the Alleghanies, was in Kentucky in 1786, the second at Knoxville, Tennessee, in 1793, and one at Cincinnati, Ohio, in 1795. In Louisiana printing was executed to a limited extent by the French as early as 1704, but on the cession of the territory to the United

States there was but one press there. In 1810 there were about ten. Presses were established in Mississippi in 1809; in Missouri and Michigan in 1810; in Indiana in 1811; in Alabama in 1812; in Illinois, at Kaskaskia, by Matthew Duncan, in 1815; in Arkansas in 1825; in Texas, by the Spaniards, in 1760, and by Americans about 1829; in Wisconsin in 1833, at Green Bay, by General Ellis, who had executed printing at that place as early as 1827 by a planer and mallet without a press, and on obtaining a press in 1833 established the first newspaper in the State. In Iowa printing was done in 1836, by W. C. Connell, and in Minnesota in 1849. In California the first press was established by Americans at Monterey, in August, 1846, and one at Salt Lake, by the Mormons, in 1848, in which year the Oregon Free Press was published by Geo. L. Curry, at Oregon City, in Oregon, which is believed to have had a press a year or two earlier. Nebraska and Kansas had each a press in 1854, and in August, 1859, the Rocky Mountain Gold Reporter was commenced at Mountain City, in Colorado Territory, by Thomas Gibson.

It is thus apparent that the newspaper which now employs so large a proportion of the presses in every part of the country, and is so valuable as a vehicle of public instruction, was an early and favorite offspring of the American press even in colonial times. Magazines and other serials were also attempted by Franklin as early as 1741, and by others subsequently. Book printing was done by the proprietors of printing presses who were often booksellers and publishers also.

In 1791 the number of printing presses in the United States was officially declared by the Secretary to be sufficient to render the country independent of foreign publishers for other books required, and to warrant a duty of 10 per cent. on books imported.

By the census of 1810 returns of printing done were made only from two States; 1 office in Vermont returned a value of \$3,194, and 108 in Pennsylvania executed work to the value of \$353,517. The number of printing offices in Philadelphia was stated to be 51, and the number of presses 153. They were supposed to print annually half a million volumes. There were 2 manufactories of printing presses in the city, including that of Adam Ramage, long afterward known as a builder of improved presses. The number of newspapers printed in the United States at that date was estimated at upward of 22,000,000 copies annually.

The relative proportions of British and American books annually consumed in the United States in 1820 was estimated by the late S. G. Goodrich to be of American 30 and of British 70 per cent. of the whole. These proportions were reversed during the next 30 years, the American being 70 and the British 30 per cent. of the total consumption.

The following table, prepared and published by the same authority from official and other data, shows approximately the value of books manufactured and sold in the United States at different periods, and the several values of each class sold:

	1820.	1830.	1840.	1850.
School books .....	\$750,000	\$1,100,000	\$2,000,000	\$5,500,000
Classical books .....	250,000	350,000	650,000	1,000,000
Theological books .....	150,000	250,000	300,000	600,000
Law books .....	200,000	300,000	400,000	700,000
Medical books .....	150,000	200,000	250,000	400,000
All others .....	1,000,000	1,300,000	2,000,000	4,400,000
Total .....	2,500,000	3,500,000	5,500,000	12,500,000

By the same writer the value of the American book trade for 1856 was estimated at \$16,000,000, distributed as follows: City of New York, \$6,000,000; other parts of the State of New York, \$600,000; Boston, \$2,500,000; other parts of New England, \$600,000; Philadelphia, \$3,400,000; Cincinnati, \$1,300,000; northwestern States, \$100,000; District of Columbia, by the government, \$750,000; southern and southwestern States, \$750,000.

Among the influences which have contributed to the growth of the book trade in the United States is the system of annual fairs and trade sales by auction. The fairs were commenced at New York in 1802, under the auspices of the American Company of Booksellers, and for a while held alternately in New York and Philadelphia, in which last the first auction sale was held in 1824. The former was suggested by M. Carey, who in 1804 issued in Philadelphia the first quarto Bible printed from movable types in America, and the trade sales were planned by his son, H. C. Carey.

Steam-power printing, which was first executed by the London Times on one of Koenig's presses in 1814, at the rate of 1,800 impressions per hour, and after 1838 on the Applegarth press, improved by Cooper, which produced 6,200 impressions hourly, was first practiced in the United States about the years 1823 or 1824, by James Booth, of New York, and according to some accounts by S. Van Benthuysen, of Albany. In 1826 Daniel Treadwell, of Boston, patented a cylinder power-press, which at once came into use and is still the principal one employed in medium sized establishments. It produced about 600 impressions hourly. In 1830 and again in 1836 Isaac Adams, also of Boston, took out patents for improvements in the power-printing press, consisting chiefly in applying power to the hand-press, which he made to work at three different velocities, averaging 900 impressions in an hour.

The double-cylinder printing press, introduced by Richard M. Hoe, of New York, and patented in 1842 and subsequently improved, combined all the improvements previously known in this country and in England, and was capable of producing 6,000 impressions per hour. It was first used in the office of the New York Sun, and is still extensively employed in country newspaper offices. In 1847 he made the first successful attempt to print with revolving type, by securing the type to the cylinder instead of a flat bed, as in his first machine. A four-cylinder press on this principle, capable of printing 10,000 sheets in an hour, was ordered for the Philadelphia Ledger office, and soon after for other establishments. The ten-cylinder presses used by the London Times and other journals in this country and in England, using as auxiliaries the gelatine rollers, invented by Gannell, in France, the distributing tables, &c., of other inventors, are capable of turning off 15,000 impressions hourly, and one in operation in New York is said to be capable of printing 25,000 in an hour, requiring ten men to supply the sheets. The Hoe presses are used in Great Britain to the number of 18 or 20, and there are upwards of 15 in use in New York city alone. The four-cylinder presses are used in France and Australia. Several improvements in the hand-press, in ink-distributing and other apparatus, have been made in the United States.

As early as 1776 Benjamin Dearborn, the publisher of the New Hampshire Gazette, the first paper in that State, introduced a wheel press, which was adopted in some places. In 1810 he devised another, in which greater power and despatch was gained by using a lever instead of a screw. Earl Stanhope's great improvement on the old press was made in 1815, by building it of iron and substituting a jointed lever for the screw, giving more power.

The first patent for a printing press was taken out in 1796 by Dr. Apollon Kinsley, of Connecticut, for an improvement on Nicholson's press, in which he placed the cylinders vertically instead of horizontally. In 1818 Adam Ramage, of Philadelphia, patented improvements on the Scotch press of his countryman, Ruthven, which he had introduced here, and at that time much esteemed for fine work. The roller for distributing ink on the types, patented in 1817 by Hugh Maxwell, of Lancaster, Pennsylvania, was a great improvement on the balls previously used for inking. The contrivance was furnished complete for \$100, and was computed to save each press \$6 per week, besides a gain in time and quality of work.

The Columbian press, a hand-press invented by George Clymer, of Pennsylvania, about the same time, was introduced in England in 1818, and is still used there extensively. In style of finish and emblematic embellishment it exceeded anything before seen there, and its efficiency there as well as in the United States, where it superseded the Ramage press then much used for newspapers, gave it immediate acceptance. It was the first press constructed in America to print two sides of a newspaper at once, which it effected by a combination of levers.

These and several others preceded the introduction of power-printing and the power-presses of Treadwell, Adams and Hoe. The Washington press, a modification of the Stanhope, was patented in 1829 by Samuel Rust, of New York, and afterward improved by R. Hoe & Co., who commenced building improved Napier and other presses in that city as early as 1819, one of the partners being Peter Smith, the inventor of the Smith press. The Ruggles press, patented in 1840, and the hand-press, patented in 1844, by Seth Adams, of Boston, have also had some repute, the latter being used for fine work at the present time.

Type-setting and type-distributing machines have been introduced by several persons in this country. Those of W. H. Mitchell, of New York, are in use in some large printing houses in that city. The type-setter resembles in form a harpsichord piano, and by means of 34 keys, each marked with a small letter, point, or space, an operator is able to adjust the types with great rapidity. A more recent invention is spoken of as combining the two operations of setting and distributing type in the same machine, the latter process being entirely automatic.

\* Part of this amount was for stereotyping.

Printing presses are now manufactured in two New England, two middle, and one western State, to the value annually of \$943,450, by 14 establishments, which employ altogether a capital of \$1,015,000 and 707 men, at a cost for wages of \$289,684, and for materials of \$145,520.

In Massachusetts one establishment, with a capital of \$200,000 and employing 100 men, manufactured presses of the value of \$103,500; and one in Rhode Island, having 35 hands and a capital of \$26,000, reported a product of \$20,500.

Seven manufactories in the State of New York employed in this business an aggregate capital of \$758,000 and 530 hands, producing printing presses valued at \$757,250, at a cost for wages of \$209,200, and for material of \$31,280, annually. Most of these are in the city of New York.

In Pennsylvania there were, in 1860, 4 small manufactories of printing presses, with a total capital of \$16,000 and 17 hands, which produced a value of \$38,700.

One establishment in Cincinnati, Ohio, had a capital of \$15,000, and made presses of the value of \$23,500.

The TYPE FOUNDRY establishments in the United States in 1860 numbered 32, having invested \$1,113,600, and employing 795 male and 312 female hands, at an annual cost for labor of \$416,404, and for materials of \$357,600. They manufactured types to the value of \$1,276,570.

Of these establishments 6 in Massachusetts, employing 166 persons, produced a value of \$176,770; 9 in New York, with 440 hands, turned out a product of \$540,400; 12 in Pennsylvania, having 263 hands, reported a product of \$308,300, of which a part was the value of stereotyping done by them. In Cincinnati, Ohio, 3 type foundries, employing 182 hands, manufactured type of the value of \$210,000. One establishment in Chicago reported a value of \$24,600, and one in St. Louis a value of \$16,500.

In Connecticut 2 manufactories of wooden types, with a capital of \$26,500 and 39 hands, returned a value of \$25,000.

STEREOTYPING AND ELECTROTYPING employed, in three States, a capital of \$126,500 and 41 establishments, having 305 persons employed and paying annually for wages \$120,840, and for materials \$60,507. They produced work of the value of \$286,300. One of these was in Connecticut, and with 6 hands produced a value of \$4,000; 11 in New York employed 162 persons, and reported a value of \$66,360; and 29 in Pennsylvania, having employed 137 hands, executed work to the value of \$51,600.

LITHOGRAPHIC PRINTING.—Lithography employed in the United States on the 1st of June, 1860, 53 establishments, in seven States. The aggregate capital invested in the business was \$445,250; the number of persons employed, including 26 females, 786; the annual cost of wages was \$338,868, and of materials \$229,206; and the value of the product was \$848,230.

Of these establishments the States of Massachusetts and Connecticut each contained two; those in the former having capitals amounting to \$10,500, and producing, by the labor of 24 persons, work valued at \$19,000, and the latter, with 23 hands and a capital of \$9,500, the value of \$17,500.

In each of the States of New York and Pennsylvania there were 23 lithographic establishments; those in New York having invested in the art \$157,850, and producing work of the value of \$383,700 with the labor of 321 hands, and those in Pennsylvania, with capitals amounting to \$255,600 and 382 hands, (19 of them females,) a value of \$386,300.

The States of Ohio, Indiana, and Missouri each contained one house for lithographic printing. The first employing \$10,000 in capital, and 29 hands, who produced work valued at \$38,000 per annum; the others, with capitals of \$800 and \$1,000 respectively, and 3 and 4 hands each, produced work to the amount, severally, of \$2,830 and \$900.

The first published specimen of American lithography may be seen in the 24th volume of the *Analectic Magazine* for July, 1819, which was but a few years subsequent to the introduction of the art into England from Germany. It was executed upon Munich stone, by Benjamin Otis, of Philadelphia, who had also executed lithographic engraving upon stone from a quarry near Dick's river, Kentucky, obtained through Dr. Brown, of Alabama, and Judge Cooper, of Pennsylvania. Lithographic work in an improved form was commenced in 1822 in New York, by Messrs. Barnett & Doolittle, who had been regularly instructed in the art in Paris. In 1824 a patent was granted to David Henderson, of Jersey City, for an improvement in lithography, and another in 1833 to Robert C. Manners, of Boston, for applying the art to reprinting books. The first regular lithographic establishment in the United States was commenced in 1827, at Boston, by W. S. Pendleton, who imported artists and materials from England and executed portraits, music, titles, and other specimens of the art with much success. The establishment continued in operation a few years ago. The second establishment was commenced at Philadelphia in 1828, by Kennedy & Lucas, but failed for want of experienced printers. Messrs. John Pendleton, Kearney & Childs commenced soon after, employing as draughtsmen Rembrandt Peale and Mr. Swett.

Mr Pendleton established, in New York, the first successful lithographic house in that city, while the business continued to be carried on in Philadelphia by Childs & Inman, Childs & Lehman, and Lehman and Duval, and, after 1836, by P. S. Duval and P. S. Duval & Son, and by other artists. In 1858 there were 235 lithographic presses in that city, and manufactories of lithographic presses and ruling machines, &c.

The number of lithographic and copperplate printers in the United States in 1850 was 26. They employed 375 hands, and executed work valued at \$247,200. Since that time the number of establishments has nearly doubled, and the product has increased at the rate of 243 per centum.

ENGRAVING.—This branch of art-manufacture employed, in 1850, 112 establishments and 480 workmen, whose labor produced a value of \$566,005. In 1860 the establishments in 10 States numbered 191; their capital amounted to \$431,650; the number of hands to 706 males and 18 females; the cost of labor to \$330,524, and of materials to \$157,171; and the value of engraving of different kinds done amounted to \$829,140, an increase of over 48 per cent.

The value of this industry, in Massachusetts, Rhode Island, and Connecticut, which had, respectively, 8, 4, and 2 establishments, was \$45,100, of which \$24,025 was produced in Massachusetts, \$17,300 in Rhode Island, and \$3,775 in Connecticut. The first employed 18 hands, the second 25, and the third 5, and the total capital in those States was \$11,800.

In the middle States and District of Columbia there were 172 engraving establishments, having

# INTRODUCTION.

altogether employed a capital of \$414,650, and 637 male and 16 female hands. The annual wages paid was \$298,284, and the cost of materials was \$147,586, the value of work executed amounting to \$766,490.

Of the whole product in those States, 97 in New York, having invested \$138,100, and employing 406 persons, returned a value of \$437,396, and 72 in Pennsylvania, with capitals aggregating \$271,000, executed, with the labor of 242 persons, engraved work valued at \$322,400 In New Jersey 2 establishments produced work of the value of \$2,950, and 1 in the District of Columbia a value of \$3,744.

There were 5 in the western States, viz, 2 in Illinois, 2 in Missouri, and 1 in Wisconsin. They produced work, respectively, to the value of \$12,550, of \$1,000, and of \$4,000, and, together, employed 18 hands. This work is principally executed in the larger cities.

## BOOKBINDING AND BLANK BOOKS.

These branches of domestic industry employ 269 establishments, 2,045 male and 2,732 female hands, and a capital of \$1,654,830, consuming materials of the annual value of \$1,554,082, and producing, with an expenditure of \$1,048,930 for labor, a yearly product of \$3,729,080, an increase of a little over 14 per cent. on the product of 1850, which amounted to \$3,255,678.

In the New England States there were 58 establishments, one-half of which were in Massachusetts. The business in these States employed a capital of \$299,250 and 960 persons, and produced work valued at \$863,223, which was a depreciation of \$114,656 as compared with its value in 1850. The falling off was in the States of Massachusetts and Vermont, the former of which manufactured to the value of \$569,680, and the latter of \$1,200, a decline in the one of \$234,740, or 78 per cent., and in the other of \$8,800, from the returns of 1850. In each of the other States there was a large increase of business. Eight establishments in Connecticut produced a value of \$147,000, an increase of upward of 24 per cent.

The middle States enumerated 132 binding and blank book establishments, having invested, as capital, \$1,072,850, and employing 1,318 males and 2,053 females, at a cost for wages of \$660,200. The value of their manufactures amounted to \$2,273,449, the increase being 23.5 per cent.

All but \$115,143 of the value in those States was returned by 120 establishments in the two States of New York and Pennsylvania. The former of these had 64 establishments, with a capital of \$490,900, and 1,140 operatives, of whom 527 were females, who received as wages \$326,312, and manufactured goods valued at \$1,173,628, an increase of 36.8 per cent., and 56 concerns in Pennsylvania, having a capital of \$518,900, and paying annually \$297,816 for the labor of 641 male and 1,474 female hands, made binding and blank books of the value of \$984,678, which exceeded the product of 1850 in the ratio of 30 per cent. and upward. In New Jersey 7 manufactories returned a value of \$65,317, which was a falling off of nearly 50 per cent., and in Maryland, which reported in 1850 a product of \$52,850, one establishment returned a value of only \$1,700.

Fifty-nine establishments in the western States employed in capital \$194,680 and 362 persons, and paid for labor \$101,562, and for material \$219,055. They manufactured to the value of \$460,608, an increase of nearly 16 per cent. in 10 years. Their business amounted to a little more than one-half that of New England, which had 3 establishments less.

Twenty-six of the western manufactories were in Ohio, and employed a total capital of \$77,780 and 202 hands, which made bindings and blank books of the value of \$212,413, which was \$9,599 less than was made in that State in 1850. The product of 8 factories in Indiana was \$104,800, an increase of over 214 per cent., and the same number in Wisconsin made work valued at \$49,750, or 332.6 per cent. more than in 1850. Four establishments in Michigan produced a value of \$40,600, and 6 in Illinois returned a product of \$18,700, each having produced, in 1850, \$12,000 worth.

From Missouri and Kentucky a large decrease in this branch, being reduced to one establishment each, was reported, while Iowa, which made no return in 1850, produced, in 5 establishments, a value of \$26,545.

The shops in 5 southern States numbered 17, combining a capital of \$76,350, and paying for material \$60,880, and for the labor of 66 males and 3 females \$32,604. The value of their manufactures was \$99,500, the increase being at the rate of 150 per centum. Of the total product in these States, \$25,500 was returned by 8 establishments in Virginia, which, in 1850, returned only \$2,500; \$49,000 by 4 in Louisiana; \$17,500 by 3 in Georgia; \$5,000 by 1 in Mississippi; and \$2,500 by 1 in North Carolina. From the two last named and from Louisiana there was no return in 1850, and South Carolina and Alabama, which in that year reported, the one a value of \$4,000, and the other of \$23,500, no report was made in 1860.

California, in 1860, contained 4 binderies and blank book factories, having capitals amounting to \$9,700. They employed 9 males and 5 females, at a cost for labor of \$6,360, and for materials of

\$10,782, and produced work valued at \$31,500. One small shop in Oregon, with a single hand, made \$800 worth of binding and blank work.

The earliest bookbinding done in America, of which we have any account, was by John Ratliffe, an Englishman, who, in 1661, received £5, or 6*d.* each, for binding in leather two hundred copies of John Eliot's edition of the New Testament in the Indian tongue, and afterwards bound the same number of copies of the Bible in quarto, with clasps, for about 2*s.* 6*d.* each. He afterward became a bookseller in Boston, where that class of tradesmen generally associated bookbinding with their business. Edward Ranger was a bookbinder and dealer in books in Boston in 1673, and of upwards of 90 booksellers who carried on business in that city previous to the Revolution, more than 30 are known to have had binderies connected with their shops, and many of them made binding a principal branch of their business. One of the number, Richard Fry, "Stationer, Bookseller, Papermaker, and Rag-merchant from the city of London," who, in 1732, kept on Cornhill, appears to have been one of the earliest blank-book manufacturers in that city. He assured the merchants in a card that he would sell them all sorts of account-books, "done after the most acute manner," 20 per cent. cheaper than they were accustomed to have them from London.

Bookbinding was carried on at Newburyport and Salem in 1761, and at New York, by Robert MacAlpine, in 1769, followed by others, soon after. Andrew Bradford, the printer, in 1718, and Benjamin Franklin, in 1729, and others in Philadelphia, and at least two in Charleston, South Carolina, executed binding, in connexion with printing and bookselling, before the Revolution.

In 1810, returns were made of bookbinding from Pennsylvania, only, where there were 102 bookbinders, whose manufactures were of the value of \$107,183. In New Jersey one binder was reported, but the value of his business was not stated.

In 1840, the number of binderies in the United States was 447, of which 147 were in the New England, 190 in the middle, 41 in the southern, and 69 in the western States. New York contained 107, Massachusetts 72, Pennsylvania 46, Ohio 41, New Hampshire 22, and the other States from 1 to 20 each.

The number of bookbinding and blank-book establishments in the United States in 1850 was 235, and their capital \$1,063,700. They employed 3,468 hands, and the value of their manufactures was \$3,255,678.

The principal improvements in bookbinding within the present century consist in the introduction of the cheaper materials of cloth and marbled paper for covering the boards, and in the greater use of machinery in the several processes of the bindery, of which last Americans make more use than European binders.

By far the larger proportion of all the books now published in the United States are put up in cloth binding, which, in addition to its cheapness and the rapidity with which work of that kind may be turned out, possesses considerable durability and capacity for ornamentation. Within the last ten years, bookbinders' muslin has been manufactured in the United States by at least one house, and marbled paper has been made for a number of years in Philadelphia of superior quality, in great variety of patterns, as well as by several manufacturers in other places. Their use has contributed to the growth of the publishing business of the country.

Bookbinders' tools for producing the ornamental work were manufactured in Philadelphia upward of forty years ago, by David H. Mason, who took out a patent in January, 1826, for ornamental rolls and stamps for bookbinders, and in partnership with M. W. Baldwin, the eminent locomotive builder, introduced many new designs. Benjamin Gaskill, established as a bookbinder of the same place previous to 1812, was one of the first to use hydraulic presses and other machinery in bookbinding in this country. The improvements since made by Americans in the mechanism for folding, cutting, block-gilding, blind-tooling, embossing, backing, finishing, &c., and particularly in cloth binding, which employs machinery to a greater extent than other kinds, are very numerous and valuable, as well as those for ruling, paging, &c., of blank books. Machines for ruling and paging commercial, account, and

# INTRODUCTION.

cxlv

blank books, in the manufacture of which Americans excel, have been invented and patented by Messrs. J. & W. McAdams, of Boston. The ruling machine produces horizontal and vertical lines in red and blue inks on both sides at one operation, and has been deemed so valuable that one manufacturer a few years since paid \$15,000 for a limited right to its use. The paging machine applies the types simultaneously to both sides of the sheet at the rate of 30 to 40 thousand impressions daily, by the labor of one man.

*Statistics of bookbinding and blank books produced in the United States during the year ending June 1, 1860.*

# MUSICAL INSTRUMENTS.

The manufacture of musical instruments in the United States employed, in 1850, in 18 States, 204 establishments, aggregating a capital of \$1,545,935. They employed 2,307 male and 24 female hands, who received in annual wages \$1,054,728, and produced, from raw materials valued at \$698,168, musical instruments to the value of \$2,580,715, whereof \$1,073,343 was the product of 58 establishments in New York, and \$903,512 that of 49 in Massachusetts, those States being the principal producers. On the 1st of June, 1860, the total number of establishments engaged in this manufacture in 19 States was 223, of which the invested capitals amounted to \$4,431,900, the number of hands to 4,461, including 7 females. The annual cost of raw materials was \$2,144,298, and of labor \$2,378,520. The value of the product was \$6,548,432, an increase of 153.3 per cent. in ten years.

The manufactures included 21,797 piano-fortes, made in 15 States; 12,643 melodeons and harmoniums, made in 12 States; 245 organs, the product of 8 States, including 2 in California; 25 aeolians, made in Maine; 12-callopes, manufactured in Massachusetts; and 300 guitars, made in Pennsylvania.

Of the whole number of establishments, 110, employing a capital of \$3,644,250 and 3,482 hands, manufactured piano-fortes of the value of \$5,260,907; 40 establishments, having a capital of \$418,400 and 451 hands, made melodeons and harmoniums to the value of \$646,975; and organs were manufactured to the value of \$324,750 in 20 establishments having a capital of \$184,600 and 265 hands. The remaining 53 establishments, representing a capital of \$184,650 and employing 263 persons, manufactured instruments of various kinds to the value of \$315,800.

New York was the largest producer of musical instruments, its factories, 77 in number, having made 12,800 pianos, 8,100 melodeons and harmoniums, and 75 organs. These employed a capital of \$2,654,700 and 2,454 hands, 4 of them females, whose wages cost \$3,392,567. The raw material consumed was valued at \$1,072,524, and the product at \$3,392,567, which was an increase of 216 per cent. on the product of 1850.

Massachusetts was the next in the value of musical instruments made, and employed 44 factories, having invested \$1,088,500, and producing, from \$667,287 worth of materials by the labor of 1,054 hands, an annual product of \$1,901,470, an increase of 110 per cent. since 1850. The articles made were 5,611 pianos, 1,296 melodeons, &c., 100 church organs, and 12 callopes.

In Pennsylvania 31 establishments made 1,188 piano-fortes, 238 melodeons and harmoniums, 17 organs, and 300 guitars, together valued at \$446,910, which was an increase of 135 per cent.

The only other States which reached a product of \$100,000 were Maryland and Kentucky, the former of which made musical instruments of the value of \$282,000, and the latter \$114,730, the increment being, respectively, 93 and 555 per cent.

The other States showed, severally, the following rates of increase in this manufacture, viz: Maine 96. New Hampshire 33, Vermont 294, New Jersey 59, Ohio 37, Illinois 330, Michigan 172, Wisconsin 486, Missouri 196 per cent. Rhode Island and Connecticut showed a decrease in the business, and Indiana, Virginia, and California made no returns in 1850.

The extent and perfection to which the manufacture of instruments of music is carried at the present day may be safely received as an index of the general progress of mankind in civilization and social comfort. It does not detract from this view of the subject to say that instrumental music is addressed merely to the ear, and therefore appears to gratify only the sensuous part of our nature with an artificial strain destitute of the charm of vocalization. We all know that the physical senses are the inlets of many of our purest pleasures, and that a delicate organization may become the medium of awakening emotions of the sublimest and tenderest kind.

In our day, the manufacture of musical instruments, considered in its economical relations, is confined to the production of a few of the larger and more perfect ones belonging to the classes of keyed instruments, which are so improved in construction and so comprehensive in their powers as to combine the characteristics of nearly all other kinds.

In this department, American skill and genius have placed our manufacturers in rivalry with

those of Europe, on which, for many years, we were dependent for our instruments of music. So unimportant was this branch of industry a half century since, that its products were recorded by the marshals in 1810 only in one State, in which they amounted in value to only \$17,830, nearly the whole of which was produced in the city of Boston. That city now contains twenty establishments, which produce, annually, upward of one and a half million worth of instruments. The State of Massachusetts, in 1860, made musical instruments to the value of \$1,901,470. In 1820 the statistics of this branch were very limited, and even so late as 1840 we find, the returns of the total value of this manufacture in the United States to amount to less than one million dollars, giving employment to nearly one thousand hands. The returns of 1850 make the aggregate value of musical instruments manufactured \$2,580,715 in value. The increase in this branch of industry in the succeeding ten years amounts to \$3,967,717, being 153.3 per centum.

Although this disparity in the product is probably, in part, due to the greater accuracy of the late returns, there is no doubt of a rapid increase in this branch in the past ten years. This is a cause of satisfaction in a social as well as economical view of the subject, as indicating the progress of a taste for refined and intellectual pleasures among the masses of the people, and also an increased ability to indulge it.

**PIANO-FORTES.**—First in importance among musical instruments stands the piano-forte, whether we regard the high place which it deservedly holds in the popular esteem, its wide-spread social influence, or the extent of its manufacture considered as a branch of trade. In addition to several powers peculiar to this most valuable of instruments, it possesses nearly all the elements of expression which belong to all others. The rapid increase, both in Europe and America, within a few years, in the number of piano-fortes relatively to the population, is not only capable of statistical proof, but is apparent to almost every one in the limited sphere of his own observation, a fact which does not apply to any other instrument. Evidence of this adaptation of the piano to the wants of the community is also found in the large proportion of piano music now to be found on the shelves of music dealers everywhere, and in the great number of persons who obtain support by teaching the use of the instrument. As the character of the amusements of a people changes with its advancement in civilization, this general disposition to transplant to the home circle enjoyments which formerly could only be indulged abroad is an evidence of progress.

In our country, where wealth is more equally distributed, the piano is no uncommon appendage to the farm-house and is often found in the cottage of the humbler class of artisans and laborers in our cities. It becomes in all, from the highest to the lowest, a source of innocent and intellectual pleasure and moral improvement. It beguiles the hours of sorrow and alleviates the cares of business, while it diffuses through all classes an increasing taste for the enjoyments of the social and domestic circle, harmonized and elevated under the influence of music. Even the higher sentiments of religion and patriotism are powerfully stimulated by its aid, as the national and sacred character of the popular songs and airs heard in public and private at all times abundantly testify.

The piano-forte appears to have originated in Germany early in the last century. The original, from which it came to its present form by successive modifications, was a more ancient instrument called the psalterium or tympanum, better known in modern times as the dulcimer. This was played by striking a series of brass wires stretched across a small box forming the musical scale, by means of a pair of little wooden hammers or small rods. Still closer approximations to the piano-forte are traced in the clavichord, in which a keyboard and digital action were employed; in the clavicitherium, of square form, in which little leather hammers acted upon strings of catgut, and in the virginal, a keyed instrument, with metallic chords vibrated by quills affixed to the end of levers or keys. The virginal is said to have been invented in England in the time of Elizabeth, and to have been a favorite instrument with the virgin queen, whence it derives its name.

The harpsichord, also a common instrument at that period, was a still nearer approach to a grand piano. It had strings of wire stretched over bridges, and operated upon by little jacks by means of

two key-boards, which could be used either separately or together. The harpsichord was a quilled instrument and was familiar to the first settlers of this country, as was also the spinet, which was only a square harpsichord. Both of these were harsh-toned instruments. Many attempts were made to improve the tones of the harpsichord, aptly described as "a scratch with a sound at the end of it," and also to adapt to it the peculiar action of the piano-forte, to which a century since it still remained superior. Unmelodious as were its sounds, the harpsichord has been honored as the medium through which Beethoven, Mozart, Handel, and other eminent composers gave forth their finest inspirations.

Marius, of Paris, is believed to have been the first, in 1716, to improve the quality and character of the tones of the harpsichord by the use of small hammers instead of plectrums of quills. Two years after Christophero, of Florence, produced an instrument which, being capable of giving forth sounds both soft and loud, was first called piano-forte. Manufactories of the instrument were established in 1760 by Zumpf in England, and by Silberman in Germany, and in 1767 the piano was introduced on the stage of Covent Garden theatre as "a new instrument."

In 1774 Joseph Merlin obtained in England a patent for a compound harpsichord, having hammers on the plan of the piano-forte. But the first grand-action piano was made two years before by Becker, a German, assisted by John Broadwood and R. Stodart, all in the employ of Tschudi, of London. They succeeded in applying to the harpsichord the piano-forte mechanism then in use, or "direct action" as it is called, which has been since employed with slight modifications by the Broadwoods in upwards of 18,000 grand piano-fortes, besides 1,500 of smaller dimensions; by Stodart, of London, and at least one large firm in this country. The earliest entry of a piano on the books of the Broadwoods was in 1771, and of a grand piano in 1781. Clementi, in the year following, first brought the grand piano into notice as a concert instrument, by playing on one of Broadwood's at the Pantheon, in London. We may here mention among the attempts to improve the harpsichord, that the ingenious Governor Hopkinson, of Philadelphia, in 1783, essayed an improved mode of quilling the instrument, and the following year received from the manufactory of the Messrs. Tschudi & Broadwood a harpsichord made according to his plan. He also attempted to adapt keys to the harmonica in 1785.

The first patent of an upright piano was taken out by W. Stodart in 1795, though its first construction is ascribed to an Englishman named Hancock. In 1794 and 1798 Southwall, of Dublin, patented what is known as the "Irish damper" for square pianos, and in 1807 introduced the "cabinet" piano. This was followed by the "cottage" upright, 4 to 5 feet high, by Robert Wornum, in 1811, and in 1827 by the "piccolo,"  $3\frac{1}{2}$  feet in height.

The ample fortunes and high repute acquired by Zumpf, Clementi, Kirkman, and others, in England; by Silberman, in Germany; and the Erards, in Paris, were the fruits of successive improvements and excellence in the manufacture of the piano-forte. The English manufacturers long maintained the highest reputation in this branch. The extent of the piano manufacture in England may be inferred from the fact that the entire number of piano-fortes of all kinds manufactured by the Messrs. Broadwood from 1771 to 1851 was 103,750, of which number 60,382 were made from the year 1824 to 1850, an average of 2,236 per annum. The Messrs. Collard, of that city, sold in the twenty years previous to 1851 about 32,000 piano-fortes. The entire production of all England in 1853 was estimated at 1,500 instruments per week, of which number about 10 per cent. were grand pianos, a like proportion were squares, and the remainder uprights.

Many improvements have been made in the piano since the great exhibition of 1851, when 173 instruments, shown by 101 exhibitors from different countries, afforded an opportunity for comparison and stimulated improvement.

The result is seen, among other things, in an extension of the compass of the piano, and has been followed by an increase of the price of first-class instruments, with a corresponding reduction in those of humbler construction. Thus Broadwood & Son's first-rate concert grands, which in 1851 sold for

175 guineas, commanded 250 guineas each in 1862, in consequence of improved construction, while small uprights of full compass were sold in 1862 at less than £20 each.

The piano-forte came into use in the United States before the close of the last century. By whom they were first made in this country is uncertain. Mr. John Osborn, who as late as 1823 made upright, grand, square, and cabinet pianos, opposite Boylston Market, Boston, and J. Thurston have been mentioned among the earliest manufacturers. As early as 1790 several piano-fortes, claimed to be equal in workmanship to any imported, were made in Philadelphia.

Even thus early had been observed and urged in favor of the domestic article the fact, since well understood, that in consequence of the great humidity of the climate of London, and that contracted in the subsequent passage of the Atlantic ocean, instruments made in England shrank and opened at the seams when brought into the dryer atmosphere of this country. This, added to the oxidation of the wires and the loosening of the keys, greatly impaired or destroyed the tone and durability of the instrument. It still remains a valid objection to foreign instruments, notwithstanding various contrivances, the most valuable of which is of American origin, to obviate the effects of a change of climate. Although artificial heat is extensively employed for this purpose, it is very inferior to the natural, and hence large capitals are required to enable manufacturers to keep a sufficient stock on hand, the best of them keeping their material from two to three years in seasoning.

The first American patent for improvement in the piano-forte was taken out in 1796 by James S. McLean, of New Jersey; and the next in February, 1800, by John Isaac Hawkins, of Pennsylvania, for an upright of novel and ingenious construction, which did not take, however, with the public. For many years the manufacture of piano-fortes, though carried on to some extent in our principal cities, continued to be quite a limited business in the United States. Our piano-makers have striven with laudable ambition, as the records of the Patent Office will testify, to improve the mechanism and qualities of the instrument. In this they have succeeded in adding some substantial improvements, among which may be named the "cast metal plate frame" for sustaining the strings, and which has been adopted abroad. This was introduced by Jonas Chickering, of Boston, who commenced business nearly forty years since. The "eolian attachment," or combination of the accordion and piano in one instrument, was invented by Obed Coleman, of Barnstable, Massachusetts, in 1842. The patent for this improvement sold in this country for \$110,000. The "reversed top piano-forte" of Conrad Meyer, one of the oldest manufacturers in the country, the "dolce campana" attachment patented in 1848, the "corrugated sounding board," and the modifications of earlier or later date, may be included among American contributions.

Many American manufacturers now produce instruments admitted by the best performers to be in all respects equal to those of any foreign piano-makers. In the selection of woods, of which a considerable variety is used in their construction, our builders possess many advantages. The principal kinds employed are pine, walnut, white holly, maple, oak, mahogany, ebony, rosewood, &c., on the complete seasoning of which, particularly in the sound-board, the perfect *timbre* or tone of the instrument is greatly dependent. To this end, as already remarked, the clearness and dryness of the climate materially contribute.

At the great exhibition in London, in 1851, all the American exhibitors of piano-fortes received either gold medals or honorable mention. Of four American contributors to the exhibition of 1862, two received prize medals, the number of competitors being 332, and the number of medals awarded 113. "For excellency of material, simplicity of style, elegance of finish, and faithfulness of workmanship, and, above all, for volume and variety, mellow sweetness, brilliancy and permanency of tone, the American pianos now challenge competition from all quarters of the world." \*

CHURCH ORGANS.—The organ is the largest, the most complicated in construction, and the most costly of musical instruments. It is also the most harmonious and the most capable of an almost endless variety of combinations, imitating the melody of all others, but exceeding all in the grandeur,

solemnity, and rich volume of its tone, and eminently adapted to the purpose for which it is more particularly used. It is an ancient instrument, but its origin is enveloped in doubt. The earliest form appears to have been acted upon by water, and the invention of this *hydraulicon* is ascribed to Ctesilaus, of Alexandria, about 220 B. C. The earliest mention of an organ with bellows (*pneumaticon*) is of one in possession of Julian the apostate, in the 4th century. The instrument was in high esteem in the time of Cassiodorus, A. D. 528. It was first introduced into some of the churches of western Europe by Pope Vitalian, about the year 670, but the earliest reliable account is of an organ sent, in 757, to King Pepin, of France, the father of Charlemagne, by Constantine Compronimus, the Greek emperor. Others were built by French artists, on the Greek model. Winchester Cathedral is said to have had an organ in 951, the largest then known, having 26 pairs of bellows, requiring seventy men to fill it with wind. It had 10 keys, with 40 pipes to each key. The organ did not, however, possess a compass of more than 12 or 15 notes in the 12th century, about which time half-notes were introduced at Venice. Pedals, or foot keys, were added by Bernhard, a German, in 1470, and large pipes of 16 to 32 feet began to be made about the same time. Before the close of the 16th century the organ had reached, substantially, its present perfection, as to general arrangement and detail of parts. The Antignati, of Brescia, were the most famous builders at that time, to whom succeeded, in the 18th century, Serassi, of Bergamo, and Callido, of Venice. Few organs in England, except that of York Minster, escaped destruction in 1641, and at the Restoration, in 1660, when there were only four organ-builders in Great Britain, foreign artists were called in. English organ-builders remained inferior to the continental, until the introduction of the works of the celebrated Bach, some thirty or forty years since, showed that true organ music could not be played on English organs, and that the true organ style was unknown to English players. The continental plan thenceforth became common. Within the last twenty years, great improvements have been made in the tone of the organ as dependent on "voicing" of the pipes, in the touch or quickness of response to the keys, and in other mechanical arrangements.

The first mention we find of an organ in America is in 1711, of one belonging to Mr. Thomas Brattle, of Boston, and probably the same that was presented by him to Queen's (afterwards King's) chapel, in August, 1713. That such an innovation in church music was not favored by the churches of that day is evident, from the fact that the instrument was not erected until the following year, having remained seven months in the vestibule of the church before it was unpacked. It continued in use from that time until 1756, when it was sold to St. Paul's church, in Newburyport, whence, after eighty years' further service, it was removed, in 1836, to St. John's church, Portsmouth, New Hampshire. The original pipes and wind-chest remain in perfect order to this day. Attempts to reform the psalmody of New England elicited strong objections to the revival of singing by note, lest it should bring instrumental music into the church. Nearly half a century after the erection of this ancient organ, we find "the complete introduction of the organ into all places of public worship" to be the subject of a pamphlet published in Philadelphia, in 1763, by a Presbyterian, on "the Lawfulness and Advantages of Instrumental Musick in the publick Worship of God," &c. A similar tract was issued in Boston, in 1771. Indeed, the first organ introduced into a Congregational church in New England was one set up in 1785 in the First church in Boston.

The first organ built in this country appears to have been erected by John Clark, in 1743, for the Episcopal church in Salem, Massachusetts. In 1754 it was presented to the Episcopal church in Marblehead, and a new one put in its place by Thomas Johnson, of Boston, who had built one in 1752 for Christ's church in that city. The Salem organ, of Johnson, a relic of which is preserved by the Messrs. Hook, of Boston, was a small organ with one bank of keys and six stops. Mention is also made of Edward Bromfield, jr., of Boston, as the builder of an organ in 1745, supposed to have been the first constructed in this country. Johnson died in 1768, and was succeeded by Dr. Josiah Leavitt, who was many years engaged in the business. He was followed by Henry Pratt, of Winchester, New Hampshire, who died in 1849, having built 23 small church organs and about 19 of less size. Mr. Pratt was succeeded by Wm. M. Goodrich, a native of Templeton, Massachusetts, but for thirty-four years a

resident of Boston, where he died in 1833, at the age of 56. Mr. Goodrich is generally admitted to have been the first organ-builder in the United States deserving the name. The superiority of his instruments to those previously constructed here gave a name and a fame to American organs, and made his reputation known throughout the Union. The importation of foreign instruments became thenceforth, in a great measure, unnecessary, and those of his construction were to be found in nearly every State. This talented self-taught artist commenced, in 1805, by building an organ for the Catholic church of Bishop Chevereaux, in Boston. In its place he set a much larger and finer one in 1822. It is said that during the whole time of his business career only three church organs were imported into Boston from abroad. Mr. Goodrich's brother and pupil, Ebenezer Goodrich, also built in Boston quite a number of small organs on his own account, and afterward in partnership with Hayts, Babcock & Appleton, on Milk street, until 1820. At this time Appleton, also a pupil of W. M. Goodrich, commenced business for himself, which he afterward continued as Appleton & Warren. The reputation of Goodrich was also ably sustained by E. & G. G. Hook, the former of whom also acquired the art of organ-building from him. They commenced in 1831, at Salem, Massachusetts, where they built 19 organs, and afterward removed to Boston, where they still prosecute the business. In 1853 there were 4 large organ factories in Boston, and a large one was started at Bellows Falls, Vermont. As early as 1808 we find mention of an organ built for the North church, in Salem, by John Geib, of New York, at a cost of \$2,800. Other churches in Salem obtained organs by Goodrich, Hook & Appleton, which cost from \$1,200 to \$1,700 each.

Organs are sometimes built of very large size. The organ of the Cathedral church at Ulm, in Germany, is said to be 93 feet high and 28 broad. Its largest pipe is 13 inches in diameter, and it has 16 pairs of bellows. Willis, of London, exhibited at the World's Fair, in 1851, an organ of great power, said to weigh 30 tons and to have 5,000 pipes.

The largest church organs in the United States, until quite recently, were in New York. That of Trinity church, the great organ of which has a compass from CCC, through 5½ octaves, has 3 rows of keys, 43 stops, and 2,169 pipes, including a double open diapason of 32 feet. The organ of St. George's church, in that city, has 47 stops and 2,446 pipes, including one of 32 feet, and that of St. Stephen's has 46 stops and 2,029 pipes. An organ in Concert Hall, Philadelphia, built by Standbridge, of that city, has 4 manuals and pedals, 60 registers, and 3,050 pipes.

The great organ recently erected in Music Hall, Boston, the masterpiece of the builder of the large organ at Ulm, is one of the great instruments of the world in size, finish, and musical qualities. It has nearly 6,000 pipes, the largest 32 feet in length, and its combinations and changes are produced by 89 stops. Its several systems of pipes are controlled by 4 manuals or hand keyboards and 2 pedals, and 12 pairs of bellows, which are to be moved by Cochituate water-power, will supply wind to its vocal throats. The exterior of the case, which is of black walnut, is covered with elaborate carvings, statuary, and emblematic devices in the highest style of art, and fills a space of 60 feet in height, 48 feet in breadth, with an average depth of 24 feet. The steam organ or calliope is an American invention.

**Melodeons.**—The melodeon has within a few years become a favorite parlor instrument. It is a frequent substitute for the organ both in public and private entertainments, uniting, as it does, much of the compass and of the deep, full, and sustained harmony of that instrument, with great cheapness of cost, simplicity, compactness, and portability of form. Vast numbers of these instruments are now manufactured in this country and in Europe, and at prices which bring them within the reach of nearly every class in the community.

The melodeon, like its congeners the seraphine, concertina, harmonicon, melophone, physharmonica, and reed organ, belongs to the class of reed instruments. The leading characteristic of these is, that the tones "are due to the vibrations of a body of air in a tube, throat, or chamber, by means of a lamina or tongue of wood or metal having one end fixed and the other lying over or within an aperture and actuated by forcibly directing through this a current of air."\* This tongue, or reed as it is

technically called, has two forms, in one of which it is larger than the aperture which it alternately opens and closes by its pulsations, as seen in the clarinet—hence termed the “beating reed;” in the other form, called the “free reed,” the tongue is slightly smaller than the aperture, as in the accordion, and oscillates within the opening, which it nearly closes. The free reed produces the most smooth, mellow, and agreeable sound; it requires no pipe, thus saving much space, is less liable to derangement, and admits of greater expression and power of tone by varying the pressure of air.

M. Grenie is said to have applied free reeds to the organ in 1810, either by original invention or by adoption either from the pitch-pipe or the Chinese organ, called *cheng*. But its early applications were chiefly to small instruments, such as those blown by the mouth, still in use, and other hand instruments, which, having a bellows and set of keys attached, became the accordion. The Accordion is said to have been brought to England from Germany in 1828, but instruments upon that principle were known in the United States several years before. Indeed its invention has been claimed, probably upon insufficient grounds, for J. H. Bazin, of Canton, Massachusetts, who took the idea from a pitch-pipe brought to him for repairs in 1821.

Whatever may have been the first application of the free reed to hand instruments, numerous modifications of it were introduced in rapid succession, particularly between the years 1825 and 1835. Among the earliest of these seen were in Wheatstone's *æolina* and concertina. The attempts to improve the accordion by enlarging and extending the scale rendered it unwieldy. Hence originated a form of organ with free reeds, and a regular key-board and bellows worked by the foot, but without pipes. This was called the *seraphine*. With slight modifications it was called in England and America the *melodeon*. The French *melodeon*, originated by M. Debain, of Paris, and improved by the M.M. Alexandre, father and son, *accordeon* manufacturers in that city, is known in its most improved form, in France, as the *orgue-melodium* or *piano Liszt*, and in the United States as the *Alexandre organ*.

The best *melodeons* have a compass of five or six octaves, the lowest note being eight feet C, the same as that of the *violinello*. The reeds are in duplicate, so that the same key always produces the same note. Stops are often added, giving to the instrument many of the effects of a small organ. A form of this instrument, known in the United States since 1825, called the *rocking melodeon*, was unsightly, tardy in sounding, and harsh in tone. Great improvements have been made in the reed instrument within the last twenty or thirty years. The most important of these it has received at the hands of Mr. J. Carhart, of New York, who perfected in 1846 the present method of acting on the reeds by suction instead of blowing. To this end the bellows and reeds were reversed, whereby greater promptness of response to the touch of the performer and a more pure and flute-like tone was secured. The sweetness of tone was further enhanced by curving the reed, called “voicing” it. These, with other patented improvements in the reed-block and reed, have contributed to the present perfection and cheapness of the instrument, which as an American manufacture is already known throughout America and Europe, in Australia, India, and the Sandwich Islands.

The combination of a free reed instrument like the *melodeon* or *harmonium*, with the *piano-forte*, in the same case, with a separate set of keys for each, so that either can be played separately, or the one as an accompaniment to the other, is the subject of a recent American patent.

Our largest *melodeon* builders make several different sizes of the instrument, ranging in price from \$40 to \$1,000 each. The largest ones, with two banks of keys, several sets of reeds and stops, rival the organ in power and tone, being in nowise inferior to the celebrated *Alexandre organ*. A single establishment in New York city, one of the oldest in the United States, employs in ordinary times about 200 hands in the manufacture of *melodeons* and *harmoniums*.

In addition to the wind and stringed instruments already noticed, and quite a number belonging to the class of reed instruments, such as reed organs, *harmoniums*, *concertinas*, and *accordions*, we may enumerate the following as embraced in the musical instrument manufacture in this country, viz: *dulcimers*, *violins* and *violinellos*, *harps*, *guitars* and *banjos*, *clarionets* and *flutes*, including India-

## HATS AND CAPS.

The manufacture of hats and caps in the United States ranks among the large branches of pure manufacture. In 1850 no less than 1,048 establishments, in 29 different States, made returns of this industry, in which there was invested an aggregate capital of \$4,427,798. It gave employment to 15,200 persons, of whom 8,226 were females, and their annual wages amounted to \$3,179,700. The cost of raw materials was \$7,100,028, and the value of the manufactures \$14,319,864. New York, New Jersey, Pennsylvania, Connecticut, and Massachusetts were the principal producers, and in the order named, the aggregate value of their manufactures being \$12,803,300, of which nearly one-half was made in New York.

The number of establishments reported on 1st June, 1860, including manufactories of hat bodies, was 622, in 30 States and the District of Columbia. They represented an aggregate capital of \$4,126,572, and employed 7,338 male and 3,503 female hands, whose labor cost, annually, \$3,638,596. They consumed 3,039,700 pounds of wool, 1,658,520 pounds of fur, and about 350,000 yards of plush, together costing, with other materials, \$8,333,454. The value of the annual product was \$16,665,475, an increase of 16.3 per cent in ten years.

The following were the principal items of production, viz: Silk hats made, 688,879; fur hats, 2,449,672; felt or soft hats, 2,462,974; wool hats, 6,191,482; total number of hats made, 11,793,007. The number of hat bodies made was 4,458,000; the number of caps, 1,646,600; and the value of caps, \$956,891, which is included in the aggregate above stated.

Nearly five-sixths of all the silk hats made, a still larger proportion of the fur hats and caps, and upward of three-fourths of the hat bodies, were the product of the middle States, in which the total value of the product amounted to upwards of 72 per cent. of the aggregate in the United States.

The New England States contain 103 hat and cap manufactories, having, collectively, a capital of \$1,013,400, and consuming 1,276,240 pounds of wool and 300,000 pounds of fur, worth, with other materials, \$1,916,312. The labor of 1,860 male and 885 female hands cost, annually, \$945,606, and produced hats, hat bodies, and caps to the value of \$3,870,431, or 23.2 per cent. of the whole product. This included the value of 62,300 silk hats, 2,500 fur hats, 909,360 felt hats, 3,093,240 wool hats, 1,080,000 hat bodies, and 114,700 caps, the last valued at \$65,825. Upward of 73 per cent. of the value made in New England, or \$2,849,031, was the product of 53 establishments in Connecticut, having, together, invested in the business \$711,500, and employing 1,268 males and 519 females at an annual cost for wages of \$657,804. The materials included 714,440 pounds of wool and 300,000 pounds of fur, and cost \$1,451,482. The product embraced 909,360 felted or soft hats of fur, 1,910,640 wool hats, and 920,000 hat bodies. It was the only New England State that manufactured soft hats, and the only one, except Massachusetts, that produced hat bodies; but it made no return of caps made in that year. The manufacture was principally confined to Fairfield county, which contained 32 establishments, chiefly in the towns of Danbury and Bethel, some of them among the largest in the United States. They employed 1,054 male and 442 female hands, and consumed 390,000 pounds of wool and all the fur worked up in New England, say 300,000 pounds, from which were made 78,169 dozen wool hats, 284,780 finished felt hats of fur, and 74,706 hat bodies. The largest establishment employed 250 male and 75 female hands, besides some others outside, and made 19,000 dozen hats of fur, valued at \$234,000. Another had 165 male and 75 female hands, and produced, annually, 29,570 dozen wool hats, worth \$240,000. Two others manufactured to the value of \$170,000 each; and 3 produced from \$125,000 to \$135,000 each. One factory made 700,000 hat bodies, worth \$500,000, using in the process 120,000 pounds of fur, costing \$270,000.

From Massachusetts were reported 33 establishments, with a capital of \$269,000 and 883 operatives, (of whom 331 were females,) receiving annually in wages \$264,580, and producing from 561,000 pounds of wool, costing, with plush and other materials, \$416,150, a total value of silk and wool hats, hat bodies, and caps, of \$931,325. The number of silk hats made was 38,700; of wool hats, 1,181,400;

of hat bodies, 160,000; and of caps, 97,600; the last articles valued at \$54,200. Of the whole value made in the State, \$183,500 was the product of 6 silk hat factories and one of soft hats and hat bodies, in Boston, in addition to 5 cap factories making upward of \$50,000 in value. Large quantities are also made at Methuen and Haverhill, in Essex county, and about 40,000 hat bodies in Norfolk county.

Only one establishment in New England was reported as having made fur hats. It was in Maine, and turned out 2,500 in addition to caps. Two others in that State made silk hats to the number of 2,600, using 1,200 yards of plush, costing \$3,117, and one factory made 100 dozen wool hats. The total value made in the State was \$14,400.

New Hampshire and Rhode Island manufactured only silk hats and caps, the former State to the value of \$23,425, and the latter of \$52,250. In New Hampshire 10,500 caps, valued at \$8,125, were made, and 5,000 silk hats, and in Rhode Island 16,000 silk hats and 6,000 caps, the latter valued at \$3,000. The cost of plush used in New Hampshire was given at \$2 25 per yard.

The middle States contained 366 establishments, of which the aggregate capital was \$2,765,190; and the persons employed numbered 5,135 males and 2,489 females, whose labor cost, annually, \$2,525,666. The quantity of wool used in three States was 1,706,150 pounds, and the weight of fur in four of them 1,343,200 pounds, at a total cost for all materials of \$6,122,723. The value of hats, hat bodies, and caps made amounted to \$12,106,546, which was the value of 567,113 silk hats, 2,376,952 fur hats, 1,519,784 soft hats, 3,024,864 wool hats, or a total of 7,518,713 hats, 3,378,000 hat bodies, and 1,343,038 caps, the value of the last item being \$743,432. New York and New Jersey greatly exceeded any other States in the extent of their hat and cap manufactures, of which each produced a considerably larger amount than all New England.

In New York the establishments numbered 150, with capital amounting to \$1,086,750, and employing 2,866 hands, of whom 886 were females, the annual wages costing \$1,017,086. The weight of wool wrought into hats and hat bodies was 1,285,850 pounds, and of fur used 635,000 pounds, of which the cost, with that of plush and other materials, was \$2,739,256. The articles turned out were 311,390 hats of silk, 338,160 of fur, 633,070 of felt, 2,157,564 of wool; total, 3,440,184 hats, 2,000,000 hat bodies, and 520,000 caps, valued at \$379,982, the aggregate value amounting to \$5,663,040. This value was upwards of 46 per cent. of the total product of the middle States, and more than one-third of the aggregate value made in the United States.

Of the whole number of factories 42 were in the city of New York and 19 in Brooklyn. In New York 39 establishments made silk hats; the whole number of hats of silk and fur finished in the city having been 321,205, or nearly one-half of all made in the State. One large concern, which owns the patent right to an invention which has made a complete revolution in the manufacture of hats, turned out all the hat bodies (2,000,000) made in the State, using in their production 475,000 pounds of fur, at a cost of \$550,000, the product being valued at \$1,200,000. The largest factory in Brooklyn employed 200 males and 50 females, consumed 30,000 pounds of fur, and produced 270,000 soft hats, worth \$577,500; another used 360,000 pounds of wool and 40,000 pounds of fur, making 600,000 wool and 180,000 fur hats, together valued at \$400,000; and a third worked up \$300,000 pounds of wool, producing, with the labor of 200 male and 75 female hands, 600,000 wool hats, valued at \$300,000. A large establishment at Yonkers, in Westchester county, made wool hats to the value of \$307,000; and another 300,000 soft hats, worth \$250,000. Nearly all the caps made in the State were the production of 18 factories in New York. There were a number of hat and cap factories at Albany.

In New Jersey 61 establishments, having a collective capital of \$833,250 and 2,078 male and 783 female hands, produced an annual value of hats and caps amounting to \$4,363,328, or more than one-fourth the total product of the Union. The expenditure for raw materials, including 75,000 pounds of wool and 596,000 pounds of fur, was \$2,464,886, and for labor \$975,816, and the manufactures comprised 50,174 silk hats, 1,871,892 hats of fur, 604,764 soft felt hats, and 160,800 wool hats, a total of 2,637,630 hats and 1,274,000 hat bodies, besides 24,788 caps, valued at \$14,000. Hat bodies were

made to the value of \$637,400 by 3 establishments in that State, which employed 68 males and 12 females, and consumed 252,000 pounds of furs, costing \$508,320. The remaining 58 concerns used 314,000 pounds of fur, 252,000 hat bodies, and 75,000 pounds of wool, from which were made, in addition to silk, felt, and wool hats, more than three times as many fur hats as were made in all other States together. The principal establishments were in Essex county, at Newark, Millburn, Orange, Belleville, and Bloomfield, in the first of which there are upward of 20 hat and cap factories.

The hat and cap factories of Pennsylvania numbered 130, and produced a greater number of caps than those of any other State, although their value was less than in New York. The aggregate capital employed by these manufactories was \$760,450, and the persons engaged were 981 males and 779 females, for whose labor was paid annually \$496,452. The materials used were 345,300 pounds of wool and 104,700 pounds of furs, besides plush and other articles, costing altogether \$840,410. The articles manufactured were 187,000 silk hats, 147,700 fur hats, 304,400 soft or felt hats, 706,500 wool hats; total number, 1,345,600 hats; of hat bodies 104,000 and of caps 685,900, valued at \$280,560. The aggregate value of the whole was \$1,901,406, or nearly one-half the product of New England, and less than one-third that of New York.

The hat manufactories of the State alone numbered 104, of which 52 were in Philadelphia. Of the latter 35 made silk hats to the number of 181,000, of which one concern made the value of \$150,000, and another \$120,000. One large manufactory of soft fur hats in Philadelphia used 40,850 pounds of furs, and employed 120 males and 80 females, making 187,200 hats, valued at \$250,000. Of wool hats, 56,475 were made in Berks county and 2,400 in Lancaster. The cap factories in the State numbered 26, of which 22 were in Philadelphia, and made 680,500 caps, valued at \$273,200.

There were 22 hat and cap factories in Maryland, two in Delaware, and one in the District of Columbia. The value of the manufacture in the first named was \$157,547, of which 68,890 was the product of 7 cap-making establishments, which made 114,350 caps, with a few hats. The value made in Delaware was \$3,225, chiefly silk hats; and in the federal District the value was \$18,000, which was altogether for silk hats made by one firm.

The western States contained 92 establishments, having \$201,673 invested in hat and cap making, which employed 195 male and 93 female hands, at a total cost for labor of \$96,376, and for material of \$179,183, the latter cost including the value of 2,860 pounds of wool, 8,450 pounds of furs, and other materials. The product was returned at \$416,000, which represented the values of 46,570 silk, 38,520 fur, 3,230 soft or felt, and 5,950 wool hats; total, 94,270; and of 184,150 caps, valued at \$142,934.

Upward of one-half of the business of the western States was done in Ohio, which reported 38 establishments and a capital of \$104,850, and an expenditure for materials amounting to \$106,957. With the labor of 87 males and 63 females, costing \$47,920, there were made from 750 pounds of wool and 4,500 pounds of fur, &c., 26,350 silk hats, 11,500 fur hats, 1,850 wool hats, and 156,000 caps, altogether valued at \$236,953, of which sum \$114,362, or nearly one-half, was the value of the caps made.

The States of Illinois, Missouri, Indiana, and Kentucky, each reported 11 establishments, Wisconsin 5, Michigan 4, and Minnesota 1. The first two produced each a value of upward of \$44,000, the next four between 15 and 30 thousand, and the last \$2,600 in value. In Kentucky only fur and wool hats were made to the number of 7,100, in Minnesota and Wisconsin only silk, and in Michigan only fur, and Indiana was the only State that reported any soft or felt hats. Caps were made in all but Minnesota and Kentucky, the largest number next to Ohio having been made in Illinois, whence 11,950 were returned, valued at \$10,572, being the product of 6 factories, of which 2 were in Chicago and 2 in Peoria county, and 4 in Wisconsin, chiefly in Milwaukee, made 7,000 caps.

In the southern States this manufacture employed 49 establishments, all but Florida having made returns on the subject. The business gave employment to a capital of \$94,657 and to 125 male and 26 female hands. Their labor cost \$46,512, and the materials used \$70,917, the latter sum including

the value of 54,450 pounds of wool and 5,270 pounds of fur consumed. The total product was \$177,764, which was the value of 4,600 silk hats, 27,010 fur hats, 600 felt hats, (made in Tennessee,) 67,428 wool hats; total of hats 99,638, and 612 caps made in Virginia and valued at \$600. The largest value was produced in Virginia, which turned out 15,700 silk, fur, and wool hats, worth \$56,475. Louisiana made 15,000 silk and fur hats, valued at \$50,000; and Alabama, 18,050 silk, fur, and wool hats, of which the value was \$26,607; Georgia, 18,000 wool hats, worth \$14,250. In all the others the value fell below \$8,000; and in Texas amounted to only \$800, which was the value of 600 wool hats made. North Carolina, Georgia, and Texas produced only wool hats.

From the Pacific States returns were made of 9 manufactories in California and 3 in Utah, the former having a capital of \$50,950, and consuming 1,300 pounds of fur, at a cost of \$43,349, from which were made by 27 hands, whose wages cost \$22,080 per annum, 8,296 silk and 3,928 fur hats and 2,100 caps, the last article valued at \$4,100, and the whole at \$91,274.

The 3 establishments in Utah employed 6 hands and 300 pounds of fur, and turned out 762 fur hats, valued at \$3,460.

Silk hats were made in 4 New England States, in all the middle States, in all but 2 of the western, in 3 southern, and in 1 of the Pacific States; fur hats in 1 eastern, 4 middle, all but 2 western, in 6 southern, and the 2 Pacific States; and felt or soft hats in 1 New England, 5 middle, 1 western, and 1 southern State, but chiefly in the middle section and 1 eastern. Hat bodies were produced only in 2 of the New England and 3 of the middle States.

**SILK HATS** are made by covering a body or foundation of felt, fur, silk, or muslin with plush or shag, having a long nap or pile of silk. The bodies were formerly made of pasteboard, chip, cane, willow, whalebone, or straw plat, but the stiffness and discomfort and other objectionable qualities caused them to be discarded for felted wool, &c. The bodies of the best silk hats are now made chiefly of Russian hare's fur, of a quality equal to that used in the manufacture of superfine beaver hats. The lightness, elasticity, elegance, and durability of the hat is in proportion to the fine quality of the body. Some of these qualities are improved by the process of water-proofing previous to napping. Many improvements have also been made in the manufacture of the plush, which was first made upon a cotton foundation; but the best is now made wholly of silk. It comes principally from France, where the best is made, particularly at Lyons, and inferior qualities from Germany and England. It was imported a few years since at a cost of from 80 cents to \$3 75 a yard. It requires about 6 yards of plush to make a dozen hat bodies, and a pound of fur, costing on an average about \$3 50, will make 13 hat bodies. The hat leathers are made of Japanned skivers, of which one dozen will make about 13½ dozen hat leathers. Other trimmings cost on an average 4 cents for each hat, and the labor and other expenses is about \$4 per dozen. The stiffening, varnishing, ironing, and drying of the hat bodies previously made on the premises or in separate establishments, as well as the finishing of fur hats, is chiefly done by men, and the sewing of the plush, trimming, &c., by females, who constitute nearly one-half of all the hands employed in hat and cap making.

**FUR HATS** were formerly made of beaver, but as that material became scarce and expensive, the furs of hares, rabbits, muskrats, neutrias, and wool, variously mixed and felted together, and afterward napped or covered with a thin coating of fine beaver's fur, were substituted, and now few, if any, even of the finest fur hats are wholly made of beaver. The bodies were formerly shaped and felted by manual labor, but these operations, particularly the forming of the hats, are very expeditiously accomplished by contrivances to be mentioned hereafter, which have greatly reduced the cost and improved the quality of the hat.

The materials used for soft or felt hats are beaver's, rabbit's, and hare's furs, and for the cheaper qualities, sheep's wool, &c., sometimes with a covering of camel's and goat's hair, &c., beaver fur being the most esteemed. These materials are first felted and then dyed, unless the natural color is retained, as in ladies' white felts and drab hats, in which the color is determined by selection of the material.

The manufacture of fur hats is one of the oldest and earliest matured branches of American industry. As early as 1662 the general assembly of Virginia offered a premium of 10 pounds of tobacco for every good wool or fur hat made in the province. Ten years later, John Clough, John Tapping, and other hatters of Massachusetts, sought exclusive privileges for their business in that colony, which were promised them by the general court, "when they should make as good hats and sell them as cheap as those from other parts." In 1675, the exportation of wool and raccoon furs from the province was prohibited, and in 1704 the felt-makers of Pennsylvania had leave to bring in a bill to prohibit the exportation of beaver, raccoon, and other furs proper and needed to be worked up.

In 1731 hat-making had become so general in the American colonies, that the felt-makers of London petitioned Parliament to prohibit the exportation thence of hats to foreign markets, which they represented to be almost entirely supplied from America, while not a few were sent to Great Britain. A special committee on the subject reported that in New York and New England beaver hats were manufactured annually to the number, it was estimated, of 10,000. In Boston there were ten hatters, one of whom furnished 40 hats weekly, and they were exported to the southern colonies and the West Indies, to Spain, Portugal, and to Ireland. It was accordingly enacted in the following year that "no hats or felts, dyed or undyed, finished or unfinished, shall be put on board any vessel in any place within any of the British plantations, nor be laden upon any horse or other carriage, to the intent to be exported from thence to any other plantation or to any other place whatever, upon forfeiture thereof, and the offender shall likewise pay £500 for every such offence," with a like penalty for every officer, and £40 for every other person, knowingly aiding in it. Though often evaded, this law remained in force until the Revolution, and many were exported to the West Indies and elsewhere from New England and more southern ports, including Charleston, where beaver hats were made quite extensively in 1765, and shipped thence to the Spanish provinces. In Danbury, Connecticut, which now turns out between one and two million hats annually, the business was commenced in an humble way in 1780, by Zadoc Benedict, who employed one journeyman and two apprentices, making three hats per diem, or less than 1,000 in a year. Before the end of the last century hat-making was carried on to some extent in every State in the Union, particularly in the maritime and larger inland towns. It was quite an extensive industry in Pennsylvania, where, in 1786, it was estimated that upward of 160,000 wool hats, and over 54,000 fur hats, were made annually. There were 68 hatters within the present limits of Philadelphia, who made 31,627 fur and 7,000 wool hats yearly. Berks county had also 38 hat-makers; York county 26; Lancaster and Cumberland, each 16; Delaware and Westchester, each 14; and each of the others, 6 to 12. The four counties beyond the mountains had 33 hatters, who made 10,140 wool and 2,200 fur hats yearly, and the whole State numbered 315 hat-makers. In 1791, New London county, Connecticut, contained 17 hatters, who made 10,000 fur and wool hats yearly. American hatters were, at that time, able to underbid the importers in proposals for supplying the army and navy with hats, and the fine beavers of home manufacture were preferred to the English. Materials only were wanting to make the supply equal to the demand.

Newark, New Jersey, was early engaged in this business, which was commenced also at Plainfield in 1808. In the following year it was computed that 50,000 hats, worth \$5 each, were made at Providence, Rhode Island, and vicinity.

In 1810, returns were made from 18 States and Territories of hats made to the value of \$4,323,744, exclusive of the product of 14 hatteries in Louisiana, not reported. The number of hatteries was returned from only 8 States, and numbered in them 842, of which number 532 were in Pennsylvania and 102 within the city and county of Philadelphia. The whole number of fur hats reported from 13 States and Territories was 457,666, and of wool and mixed hats made in 7 States, 1,095,465. Of that number 474,924 wool and mixed hats, and 45,369 fur hats, were made in Pennsylvania, and valued at \$1,288,246, about one-half of which was made within the present limits of Philadelphia. From Connecticut the value only was returned, and amounted to \$522,209, of which \$348,791 was the product

of Fairfield county, the largest factory being at Danbury. In Massachusetts, 142,645 fur hats were made, valued at \$415,167, or nearly \$3 each. In Rhode Island, the value of fur and wool hats made was \$269,992, and in New York 124 batteries reported 104,014 hats, averaged by the marshals at \$2 50 each, or \$260,035. Virginia, next to Pennsylvania, returned the largest number of wool hats made, viz: 276,267, valued at \$397,979; and Maryland, a value of \$321,712, chiefly fur hats made in 106 establishments. New Jersey made 31,524 fur hats, valued at \$94,052, an average of \$2 98 each. They were chiefly made in Essex county, at Newark and vicinity.

In Pennsylvania, a patent loom was in operation for making hats of cotton, and also of straw.

Several of the States, at that date, supplied their own consumption; and others, as Massachusetts, Connecticut, New York, and Pennsylvania, produced a considerable surplus for exportation.

The report of Mr. Gallatin, Secretary of the Treasury, to Congress, in April, 1810, stated the annual importation of hats to be \$350,000, and the exportation of American hats \$100,000, showing the domestic manufacture to be nearly equal to the home consumption. In that document the manufacture of hats was estimated at a much higher sum than was returned by the census. From information obtained, the business in Massachusetts, alone, appeared to have employed a capital of \$3,000,000, and about 4,000 persons, and the number of hats made annually was 1,550,000, of which 1,150,000 were fine hats, valued on an average at four dollars each, and 400,000 were felt hats, worth one dollar each, which would make the total value exceed that reported by the marshals for the whole Union. The Hat Company of Boston estimated the hats made in the State to be four times the number required for its consumption. Many of the fur hats made in Rhode Island, Connecticut, and Pennsylvania were estimated at \$5 each, and country-made hats sold at \$3 each. The total value of hats made was estimated in the report at nearly \$10,000,000.

In 1831 the manufacture of hats in the United States for home consumption was estimated by a convention of manufacturers at \$10,000,000 annually, and the yearly exportation of domestic hats at \$500,000 more, making the annual value of the manufacture \$10,500,000, which was estimated to employ 15,000 men and boys and 3,000 women. American hats were manufactured at a less price, considering their quality, than was paid for them elsewhere. The whole value of hats and caps made in the United States was computed at \$15,000,000 annually.

The census of 1840 made the value of hats and caps manufactured in the United States to be only \$8,704,342, of which New York produced \$2,914,117, and New Jersey \$1,181,562.

Previous to that time several inventions had been introduced in Europe and America for facilitating the manufacture of hats and hat bodies, which was still in a great measure effected by manual labor, although a committee of hat manufacturers reported to the New York convention in 1842 that hats were then sold from 25 to 50 per cent cheaper than they were ten years before, fur hats of fair quality affording a profit at \$1 50 each, which formerly sold for \$2 to \$2 50 each, and the first quality, which ten years before ranged from \$6 15 to \$10 each, being sold for \$5.

Among the early patented inventions by Americans, the first was granted to James Long, of Maryland, in 1799, for a method of napping hats; and one patented by Roswell Pitkin, of East Hartford, Connecticut, in 1808, for forming hats, cloths, &c., from the fleece without bowing, which was at that time the universal practice. In 1812 Messrs. Holladay & Griffin, of Lyme, in that State, received a patent for a machine for bowing wool, &c., for hats; and Mr. Griffin received another for the same purpose in 1815. A mould for forming wool and rorum hats was patented in 1813 by John Warely, of Albany, New York. A machine for making bats or frames for wool hats was patented by Richard Gookins, of New Hampshire, in 1806; and in 1819 Silas Mason, of Norfolk, Massachusetts, recorded a patent for manufacturing hats by the help of a carding machine, which produced the hat in a conical form at a single operation. At that date bowing machines were in operation in two hat factories in Lyme, Connecticut, the patents for which were held by the proprietors, probably the individuals before mentioned. There was another establishment at East Hartford, in which the principal labor of hat-making was said to be done by machinery, (probably Pitkin's,) patented by the proprietor.

In April, 1825, and again in 1827, Joseph Grant, of Providence, Rhode Island, obtained letters patent for improvements in the mode of making hat bodies, by aid of a machine for winding and setting up the bodies. In November of that year a machine for the same purpose, said to be of foreign invention and ingeniously contrived, was patented in England by Mr. Borrowdale. A steam factory for making hat bodies, under Grant's patent, was in operation in Pittsburg, Pennsylvania, in 1837. It was adapted, we believe, for forming wool hat bodies by winding the fleece from a carding machine upon two cones united at the base.

Steam was applied to the making and hardening of hats by Jonathan Sizer, of New London, Connecticut, in 1811, and by N. Wildman, of Danbury, in 1824. And in 1829 a machine for scalding and napping hats by steam was the subject of a patent by Daniel Baldwin, of Ithaca, New York. Four years later machinery for napping hats by steam was in successful operation in Philadelphia. Water-proof stiffening was the subject of a patent by William Buckles, of Baltimore, in 1817; and in 1835 a machine for stiffening hat bodies by immersing them in solutions of different strengths and afterward pressing them between rollers—a process still in use—was patented by Henry Blynn, of Newark, New Jersey. It was said to enable one man to do as much work in one hour as five could do by the old process. Water-proof stiffening has effected much saving in the material of fur hats, and at the same time rendered them more light and elastic. It has been the subject of some valuable improvements in England.

Hardening hats upon a cone was covered by a patent granted to Stephen Hurlbut, of Glastonbury, Connecticut, in 1831.

For machinery for forming hat bodies several patents were taken out by different persons in 1829. But the germ of the present improved mode of giving to the materials the primary fitting and of forming the hats for fur hats, by what is known as the pneumatic process, was introduced by the late Thomas Blanchard, of New York city, and was contained in machinery patented by him in June, 1837. It consisted in forming a thin web or fleece of fur by means of a rapidly rotating picker brush to disintegrate the materials and throw them upon an endless apron or band of fine wire cloth, passing over rollers; upon which wire cloth the fur was deposited by a current of air, produced by an exhausting fan beneath the apron. The thin, narrow, ribbon or web thus formed was wound upon a double cone of a size to form two hat bodies. The machine was not successful in practice, but H. A. Wells, one of the proprietors, early conceived the idea of depositing the fur directly upon a pervious cone connected with an exhausting fan beneath, which would produce a current of air through the cone from all sides.

On visiting England soon after to introduce the Blanchard machinery and other improvements in hat-making, patented by H. A. Wells and R. W. Peck in 1837, Mr. Wells found Thos. R. Williams, an American, engaged with machinery for bowing, breaking up, and felting wools for hats by means of a carding engine for preparing the fibres, and of pervious cones and exhausting fans for forming the web which was afterward agglutinated by dipping in a sizing liquid. His process was patented in England; and in 1840 he took out in the United States a patent for so much of the mechanism as related to the making of felt cloths without spinning or weaving, abandoning that relating to hats which did not come into successful use. Mr. Wells by experiment reduced his idea to successful practice, and took out his first patent in April, 1846, which he assigned to Henry A. Burr and others in New York, by whom it was resigned, and to whom, in September and October, 1856, it was reissued in two separate patents, the one for forming the hats, and the other for hardening and removing them from the cone. These have since been extended and reissued, and are still owned by Mr. Burr and partners, who have added other improvements, and purchased the patent rights of several other inventors.

Under an upright perforated cone of sheet copper, revolving slowly on its axis, a vacuum is created by an exhausting fan which rotates 4,000 times in a minute, and by means of the current of air through the holes the fur, previously prepared by blowing and other machinery, which separates the long hairs from the short, is deposited on the outside in quantity sufficient to form one hat body at a time. A

wet cloth is then thrown over the cone, and the whole is removed to a vat of hot water, and the subsequent felting and sizing is done either by the hat-finisher or in separate establishments, by hand, though some have employed a sizing machine of French invention for fulling up the bodies previously made in the "forming machine."

By this "former," two men and a boy, with a third person to roll the bodies, can complete in a day 400 to 450 hat bodies, all alike in weight, shape, and thickness, and better made than they were by the old process, by which one man could make only four or five in a day. The cost of labor for forming and sizing hat bodies has been reduced in proportion, from 56 cents to 6 or 10 cents. Nearly all the hat bodies are now made by this mode, either by Messrs. Burr & Co., in New York, or by their agents and licensees throughout the country, the manufacturers generally furnishing the materials, which are made into hat bodies of such weight and quality as may be ordered.

From January 1, 1846, when this machinery went into operation, to December 31, 1859, the number of hat bodies made under this patent by Messrs. Burr & Co., and by others, at Milburn and Newark, New Jersey, was 41,431,693. The patentees, in 1856, manufactured three million hat bodies, and other authorized producers had a capacity for making about as many more.

In 1860 the former returned a manufacture of two million of hat bodies, of an average value of 60 cents each. An improvement in machinery for making hat bodies was patented during that year, by Seth Boyden, of Newark, New Jersey, which, we believe, is used in one or more of the large establishments in that place.

The following approximate estimate of the annual importations of hatters' materials was given by a writer in 1853, viz: 560,000 yards of silk plush, (French,) at an average cost of \$2 per yard, \$1,120,000, which will make 1,120,000 hats, worth, at retail, \$4,408,000; 90,000 yards of silk plush, (German,) at an average of \$1.38 per yard, \$121,000, which will make 180,000 hats, worth, at retail, \$540,000; 800,000 yards of Angola cotton plush, (French and German,) at \$1 per yard, \$800,000, from which can be manufactured 2,400,000 hats, worth, at retail, \$1.25 each, \$3,000,000; coney and hares' furs, imported from France and Germany, \$1,000,000. These materials are used for the bodies of hats and the making of California and soft hats. About 4,000,000 of these latter are made, annually, in this country, at an average of \$1, which will make \$4,000,000. Amount of other goods used by hatters, such as trimmings, bindings, bands, &c., the greater part of which are imported, \$2,100,000.

In the year ending June 30, 1860, the importations of hatters' furs, dressed and undressed, amounted to the value of \$1,222,811; of hatters' plush, of cotton and silk, to \$68,965; and of hats, caps, and bonnets, of silk, (chiefly from England,) \$95,529. During the same year we exported, chiefly to Canada and the British provinces, Hayti, and the Sandwich Islands, hats of fur and silk to the value of \$118,770.

In the corresponding year 1862 the value of hatters' furs imported was \$929,534; of cotton and silk or wool plush, \$14,110; and of hats of hair, whalebone, and like materials, \$38,553. The value of wool or silk hats exported in the latter year was \$77,281.

The duty on hats and caps of wool, fur, &c., was laid in 1816 at 30 per cent. ad valorem. In 1842 wool hats and hat felts or bodies were charged with a duty of 18 cents each; cotton hat bodies, 30 per cent.; fur hats and caps, 35 per cent.; fur hat bodies or felts and hatters' furs, 25 per cent.; and all other hats, 35 per cent. In 1846 wool hats and felts were made subject to a duty of 20 per cent., and other kinds, 30 per cent., hatters' furs paying 10 per cent. These duties were changed in 1857 to 15 per cent. on wool hats and hat bodies, and 24 per cent. on all other kinds, and on hatters' furs to 8 per cent., from which rates the duties were raised in 1862 to 30 per cent. on wool hats; 25 per cent. on wool felts; 35 per cent. on cotton hat bodies; fur hats and caps, and fur felts; and 20 per cent. on hatters' furs dressed, not on the skin.

# INTRODUCTION.

Statistics of Hats and Caps (including hat bodies) produced in the United States during the year ending June 1, 1860.

STATES.	No. of establishments.	Capital invested.	Pounds of wool used.	Pounds of fur used.	Cost of raw materials.	NO. OF HANDS EMPLOYED.		Annual cost of labor.	Ann. value of product.	No. of silk hats.	No. of fur hats.	No. of felt or soft hats.	No. of woolen hats.	Total number of hats.	No. of light bodies.	No. of caps.	Value of emp.

## COAL MINING.

The mining of anthracite and bituminous coals in the United States, in 1850, employed 510 establishments, with an aggregate capital of \$8,317,501. They employed 15,118 persons, including 6 females, whose annual wages cost \$4,069,188, the cost of raw materials being \$246,414. The product of all the mines, distributed throughout 12 States, was valued at \$7,173,750, of which sum \$5,268,351, or upward of 73 per cent., was the value of anthracite mined in Pennsylvania.

The statistics of this business in 1860 embraced returns from 16 States and Territories, and from 622 establishments, of which the aggregate capital amounted to \$29,428,670. The number of persons employed was 36,469 males and 17 females, to whom were paid, in annual wages, \$9,650,264, or \$264 each. The cost of raw material was \$2,752,972. The product was 6,218,080 tons or 155,452,000 bushels of bituminous, and 8,115,842 tons of anthracite coals, valued together at \$20,243,637. This showed an increase in the value of fossil fuel raised of no less than \$13,069,887, or 182 per cent. over the returns of 1850. Capital was attracted to this branch of industry during those ten years in the ratio of 253 per centum, the increment alone amounting to the sum of \$21,111,169. The increased expenditure for raw materials, such as fuel, oil, &c., was at the rate of 1,017 per centum in the same time. Missouri alone showed a falling off both in capital and product. The whole quantity of soft and hard coals raised was 14,333,922 tons, and the average price \$1 41 per ton; the average of bituminous coal being \$1 34, and of anthracite \$1 46 per ton. On an average of the whole quantity, the mining cost, for labor and materials alone, \$1 15 per ton.

The State of Pennsylvania is by far the largest producer of both anthracite and bituminous coals; all but 1,000 tons of the total quantity of the former having been raised in that State. The coal mining establishments of Pennsylvania in 1850 numbered 246, and in 1860 had increased to 310. The capital employed in the business augmented in the same time from \$5,313,721 to \$17,602,030, and the product from \$5,268,531 to \$14,746,153, showing in the capital an increment in ten years of \$12,288,309, or 331 per cent., and in the value of coal mined of \$9,477,622, at the rate of 179.9 per cent. The number of hands employed in 1860 was 29,777, and their annual labor cost \$7,213,496, an average of \$269 to each hand. The cost of raw materials was \$2,105,284.

The mining operations of that State yielded, according to the returns, 2,690,786 tons, or 67,269,650 bushels of bituminous and 8,114,842 tons of anthracite coal, valued, as already stated, at \$14,746,153, which was about 72 per cent. of the total value of coal mined in all the States. If to this be added 6,093,150 bushels of bituminous coal, (worth at the mines \$335,692,) unofficially reported as the product of that year, and not included in the returns of the marshals, it will make the total product of bituminous fuel in Pennsylvania 73,362,800 bushels, or 2,934,512 tons, of the value of \$3,212,271, and in the United States 161,545,150 bushels, or 6,461,806 tons, valued at \$8,704,755. The yield of Pennsylvania in both kinds of coal thus becomes 11,049,354 tons, and the value \$15,081,845, and the product of the whole country is raised to 14,577,648 tons, worth \$20,579,329.

Agreeably to instructions, the returns of the value of coal gave the value at the mines, exclusive of the cost of transportation. In most manufactured articles, the cost of moving them to market is a very small percentage on the value at the place of manufacture, but in 1860 the cost of transporting coal to tide-water was 50 to 100 per centum of its cost at the mouth of the pit. At an average cost for transportation of only 50 per cent. on its cost at the mines, the total quantity of coal mined in the United States would be worth, on reaching a market, at least \$30,868,993, and that of Pennsylvania \$22,627,767.

Of the aggregate business in Pennsylvania, the Anthracite trade employed 176 establishments, having a total capital of \$13,880,250, working 25,126 hands, at an annual cost for labor of \$5,503,124, and for raw material of \$1,637,898. The value of the anthracite raised (8,114,842 tons) was \$11,869,574 at the mines. It was produced in the counties of Schuylkill, Luzerne, Carbon, Northumberland, Dau-

phin, and Columbia, which, in their relative amount of trade, ranked in the order named. The first named county had 95 mining establishments and 15,053 hands, and produced 4,134,687 tons of anthracite, valued at \$7,217,210, its business constituting more than one-half the whole anthracite trade of the State. In Luzerne county there were 50 establishments, employing 6,048 persons, and producing 2,547,500 tons of coal, worth \$2,812,000, or about one-fourth of the whole yield of the State. Carbon county, with 11 establishments and 1,706 hands, mined 731,000 tons of anthracite, worth \$955,000. Dauphin had only two concerns, but the amount of capital, number of hands, and product indicate that they were relatively the largest operators in the State. The average capital of all the establishments was \$78,808, and the average product was \$67,440, while the two in Dauphin county had, together, a capital of \$650,000, and shipped coal to the value of \$265,000.

The only State besides Pennsylvania in which anthracite is mined is that of Rhode Island, which had one operator, employing a capital of \$5,000 and 12 hands. The quantity of coal raised was only 1,000 tons, valued at \$5,000.

The Bituminous coal trade of the United States employed 445 mining establishments, with an aggregate capital of \$15,543,420. They expended for raw materials \$1,114,074, and gave employment to 11,331 men and 17 women, whose labor cost annually \$4,143,540, an average of \$365 each, or \$101 per annum more than was paid to miners of anthracite. The aggregate product of this species of fuel has already been stated to be 161,545,150 bushels, worth \$8,704,755, or about 5.38 cents per bushel. It included that omitted by the marshals in Pennsylvania, which was the largest producer, and contained 134 establishments, with a capital of \$3,721,780 and 4,651 hands.

Next to Pennsylvania, the largest return of bituminous coal was made from Ohio, which had 69 establishments, with an aggregate capital of \$750,910 and 1,678 hands. The product of that State was 31,640,000 bushels, valued at \$1,653,553.

In Illinois there were 73 mining firms, having together \$3,169,290 invested. With 1,480 hands they raised 18,210,000 bushels of bituminous coal, worth \$1,285,501. These were the only States in which the value of coal mined reached \$1,000,000. The next in the value of its product was Virginia, in which 22 establishments reported a capital of \$2,191,400 and 1,190 hands, of whom 3 were females. They mined 11,834,000 bushels of coal, valued at \$798,128. In Maryland there were 8 establishments, which reported a larger aggregate capital than those of any State except Pennsylvania. The amount invested was \$3,415,000. They gave employment to only 705 persons, and made returns of 10,950,000 bushels of coal raised, of which the value was \$464,338. Thirty-three establishments in Kentucky employed 757 persons, including 11 females, and produced 7,144,000 bushels of coal. In Tennessee, whence there was no return of coal mining in 1850, the quantity produced was 4,132,500 bushels, worth \$423,662; in Indiana it amounted to 2,500,000, and in Iowa to upward of 1,000,000 bushels, and in Washington Territory one establishment reported a capital of \$25,000 and a product of 134,350 bushels, worth \$32,244. Rhode Island, Michigan, Missouri, Georgia, Alabama, and Arkansas, produced smaller amounts of bituminous coal, but in all except Alabama (where it reached 255,000 bushels) the product was less than 100,000 bushels in each State.

The average capital of each establishment in this branch of the coal trade was \$34,929; the average number of hands employed by each was 25; and the average product in quantity and value was 363,022 bushels, worth \$19,561.

The value of bituminous coal at the mines, on an average of the whole product, was a little more than 5 $\frac{3}{4}$  cents per bushel. In Rhode Island it was 30 cents; in Pennsylvania, 4 $\frac{3}{4}$  cents; in Maryland, 4 $\frac{1}{4}$  cents; in Virginia, 6 $\frac{3}{4}$  cents; in Alabama, upward of 16 $\frac{3}{4}$  cents; in Tennessee, 10 $\frac{1}{4}$  cents; in Ohio, less than 5 $\frac{1}{4}$  cents; in Illinois, 7 cents; in Iowa, upward of 8 $\frac{3}{4}$  cents; in Missouri, not quite 8 $\frac{1}{2}$  cents; and in Washington Territory, 24 cents per bushel.

The following are the rates per centum in which the several States increased their values of all kinds of coal mined in the ten years preceding the eighth census, viz: Iowa, 220.4 per cent.; Illinois, 170.8; Indiana, 651.8; Alabama, 236.9; Kentucky, 200.9; Pennsylvania, 186.2; Maryland, 136.9;

Ohio, 129.6; Virginia, 70.7; Rhode Island, 48.8; and Arkansas, 20 per cent. The increase in the product of all the States, with the addition before mentioned, was \$13,405,579, or 186.8 per cent. In Missouri the mining of coal fell off in value from \$226,118, in 1850, to \$8,200, or 96.3 per cent. The returns made from Michigan, Georgia, Tennessee, and Washington Territory were the first ever received from those districts.

Although the mining of coal in several of the western and southern States is yet in its infancy, and limited in extent, notwithstanding the large percentages which are calculated on small amounts, yet the general distribution of that valuable mineral throughout the different sections of the Union, and the large amount of capital invested in mining in some States, render these statistics interesting when considered in their relation to the iron and other minerals found in proximity with the coal, and to the steam navigation, railways, and various industrial enterprises of the several States.

The increased production of mineral fuel by Pennsylvania must, however, be considered extraordinary, whether we regard the recent origin of the trade, its great development in the ten years preceding 1860, or the important relations which its present magnitude bears to the great centres of industry in that and neighboring States. The decade embraced a period of more than ordinary financial embarrassment in every branch of productive industry. Indeed, the enterprise of her citizens in developing the vast resources of that State in fossil coal is only limited by their ability to command transportation to the markets. Her almost exclusive possession of the anthracite deposits of the country, her proximity to the seaboard and to the great manufacturing establishments of the eastern and middle States and to the salt works of New York, of which coal is the aliment, as well as the outlets she possesses by way of Lake Erie and the Ohio river to the markets of the west, give her unequalled advantages for the extension of what is already a principal source of her commercial and manufacturing prosperity. Coal being a prime essential for the generation of motive-power for locomotive, marine, and stationary engines, of illuminating gas for our growing cities, and for the comfort of the domestic hearth, the demand cannot fail to be enormously increased with the rapid advance in population and every form of productive enterprise which may be looked for with the reinstallation of the arts of peace. With enlarged facilities and cheaper means of conveying coal to market, and with the improved appliances almost daily introduced by the mining engineer, we may confidently anticipate that the next census will reveal an unprecedented increase of the coal trade, not only of Pennsylvania, but of every State in which coal has been mined. In value of product the coal measures of the United States already exceed the annual yield of all the gold and silver mines of the American continent at the commencement of the decade under review. As a dynamic agent in maintaining the activity of our workshops, railways, and steamboats, as an employer of active, intelligent, and moral labor, and of well-directed capital, if not in its actual commercial value, there is no doubt that the mineral coal of the United States is a more potential element in the general prosperity of the country, material and moral, than the gold of California, however abundant. Next to that of gold, it is the most important mining interest in the United States.

The coal area of the United States was estimated in 1845 to cover 133,132 square miles, or 85,204,480 acres, which was nearly one-fourth of the total area of the 12 States in which the coal formations lay. It was equivalent to nearly three-fourths of the coal areas of the principal coal-producing countries of the world. Of this area, 8,397 square miles were on the west side of the Mississippi, and 437 square miles were occupied by the anthracite deposits of Pennsylvania. More recent estimates\* have made the American coal-fields, so far as they have been developed, to cover nearly 200,000 square miles. The coal areas of Great Britain and Ireland, by far the most productive in the world, are estimated to cover about 12,000 square miles, or 1-10th the entire area of the kingdom. The coal formations of British America are computed to have an area of 18,000 square miles. In 1845 the production of the British coal-fields was set down at 31,500,000 tons annually. The product in 1858 was stated to be upward of 65,000,000 tons, worth £16,700,000 at the pit; about one-sixth of which

\* Report of the Commissioner of the General Land Office.

was supposed to be employed in generating force, equivalent to the power of 55,000,000 of men. An eminent geologist estimates the average thickness of the workable coal of Great Britain at 35 feet, and the total quantity of workable coal at 190,000,000,000 tons. If the whole area of the productive coal-fields of North America be taken at 200,000 square miles and the average thickness at 20 feet, the product will be 4,000,000,000,000 tons. The relative amplitude of the coal measures of our own and other countries may be made more appreciable by taking the amount of workable coal in Belgium as 1, then that of the British islands becomes rather more than 5, that of all Europe  $8\frac{1}{2}$ , and that of North America 111.

This great extent of coal area has in the United States been usually divided into four principal coal-fields or tracts, viz: the great Central, Alleghanian, or Apalachian coal-field, extending from Tuscaloosa, in Alabama, through Eastern Tennessee and Kentucky, Western Virginia, Maryland, Ohio, and Pennsylvania, and reappearing in New Brunswick and Nova Scotia. This field has been computed to cover within the United States an area of 50,000 to 60,000 square miles, of which about 40,000 square miles, or 25,600,000 acres, are considered workable area. It is subdivided into eight minor divisions productive of bituminous coal. The second coal-field occupies the greater part of Illinois and Indiana, and in extent is nearly equal to the first. A third field covers a large portion of Missouri; and the fourth the greater part of the State of Michigan. The Chesterfield bituminous coal-field, a detached district of small area near Richmond, Virginia, contains the oldest working collieries in America, and for many years furnished the only supply of coal for the seaboard towns.

The greater part of the area of workable coal in the bituminous coal-fields above mentioned remains as yet almost undeveloped.

The detached basins of anthracite coal in Pennsylvania, which form one of the most interesting portions of this great coal-producing territory, though limited in aggregate area, as yet produce considerably more than all the others together.

This anthracite region is usually spoken of under three separate divisions: the Schuylkill or southern, the middle, and the Wyoming, Wilkesbarre or northern coal regions, each of them, particularly the middle, consisting of a great number of separate or subordinate coal basins. The existence of this valuable fossil has been known for about a century, but attracted no attention until about the year 1791. It is less than fifty years since it became an article of any commercial value.

#### HISTORY AND STATISTICS.

The earliest historic mention of coal in this country is believed to have been made by Hennepin, the French Jesuit missionary, who, in 1679, saw traces of bituminous coal on the Illinois river, and on the map illustrating his journal marks the site of a "cole mine," above Fort Crevecoeur, near the present Ottawa. In 1763, Colonel Croghan, a British officer sent to conciliate the Indians, by whom he was taken prisoner, noticed on the south side of the Wabash "a high bank in which are several fine coal mines," which is the earliest reference to coal in that region. In the map of Captain Hutchins, published in London fourteen years later, coal mines or beds are marked on the western side of the Ohio river, and other bituminous coal seams were noticed near the same time in the great basin of the Ohio. One of these, near the site of Pittsburg, took fire about the year 1765, and burned for upwards of sixteen years. This tract was purchased of the Indians by the Penns, in 1736, and by later purchases in 1768 the whole bituminous coal-field south of Kittanning, including the northern or Wyoming anthracite region, became the property of the family at a cost of about \$10,000. The portion lying north of Kittanning was purchased in 1784, and in the same year the town of Pittsburg was laid out and the Penns granted the privilege of mining coal in the "great seam," opposite Pittsburg, which is there six feet thick, and was long regarded as the largest stratum of coal in the country. The price for mining privileges was £30 per lot, extending back to the centre of the hill.

One of the first purchases of land from the State for the sake of its coal deposits was of a tract near Oldtown, now Clearfield, on the West Branch of the Susquehanna. The land was taken up and

patented by Mr. S. Boyd, on November 1, 1785, but no coal was sent eastward of the Alleghenies until 19 years later. In 1804 Mr. W. Boyd shipped from that place the first ark-load of bituminous coal to tide-water, at Columbia, in Lancaster county, a distance of 260 miles. Its arrival was a cause of great astonishment to the people, who were wholly unacquainted with the article. From that time a limited trade in coal was carried on from that vicinity by arks and canal boats with the towns and iron-works on the Susquehanna. In 1828 the first cargo of Pennsylvania bituminous coal reached Philadelphia from Karthaus, in Clearfield county, and some coal was about the same time sent to Baltimore from the same source.

The great Pittsburg coal seam above mentioned, which is widely extended along the Ohio, Allegheny, and Monongahela rivers, with others of minor value in the vicinity, have been the great stimulus to the almost unrivalled manufacturing enterprise of that city, which, as early as 1825, was estimated to consume, annually, one million bushels, or 35,714 tons of coal, and in 1864 nearly nineteen million bushels. The extent of the bituminous coal-field surrounding Pittsburg has been estimated\* at 15,000 square miles, or 8,600,000 acres. The upper seam alone of this area, rated at an average thickness of 8 feet, is estimated to contain 1,498,464,000,000 bushels, or 53,516,480,000 tons of coal. From the original mining privileges of Coal Hill, opposite Pittsburg, operations have extended seventy miles up the Monongahela, as many up the Youghiogheny, and a distance of 20 miles or more along the Pennsylvania Central and Alleghany Valley railroads. The coal veins of the Monongahela, which vary in thickness from  $4\frac{1}{2}$  feet at Pittsburg, to 7 and 8 feet at Brownsville, and in some places reach 10 feet, have been the most extensively worked in consequence of the ready outlet offered by the slack-water navigation of that river. This is divided into 5 pools, in which 69 collieries have been opened within the last 20 years, 12 of them in the last and 5 in the present year, (1865,) and employing 3,485 hands. The total quantity mined from 1845, when there were 3 collieries, producing for home consumption 1,944,845 bushels, and for exportation 2,660,340 bushels, to 1864, when the amount exported was 29,541,367 and the consumption 5,529,350 bushels, amounted altogether to 366,732,263 bushels, or 13,097,581 tons. The cost of this coal, including digging and loading, was, in 1860, from \$1 25 to \$2 per 100 bushels, or 31 to 50 cents per ton, since which time it has risen to about \$7 per 100 bushels. It is transported on flats, barges, and boats; the first holding about 2,000 bushels each, and used for transporting it to the city market; the barges having modelled hulls, employed for towing it to the lower markets, have a capacity of about 11,000 bushels; and the boats, 125 to 150 feet long, about 16 feet wide and 8 feet deep, with flat ends, sides, and bottoms, hold about 20,000 bushels each, and are floated in pairs to the lower markets of the Ohio and Mississippi valleys.

The coal basin of the Youghiogheny river is distinct from the one just mentioned, and lies 400 feet above the Pittsburg coal seam, and covers an area 20 miles long by 5 miles wide, divided by the river. The coal is of superior quality, and being free from sulphur, produces some of the best coke known. Since 1845, when there was but one mine opened, 22 collieries have been put in operation, six of them within the present year.

Exclusive of a large amount of coal which goes to market by way of the Monongahela, and included in the preceding statistics, the Pittsburg and Connellsville railroad carried, principally to the home market, in 1860, 842,044 bushels, and in 1864, 3,664,892 bushels or 130,889 tons, mined at about the same cost as in the Monongahela district.

In the hills around Pittsburg there are also 10 or more collieries, embracing an area of about 1,570 acres, which produced, chiefly for the use of rolling-mills, in 1860, about 1,937,500 bushels, and in 1864, 3,675,000 bushels, or 131,250 tons.

Along the Pennsylvania railroad, coal mines occupying about 1,405 acres sent to Pittsburg in 1855 about 110,000 tons, and eastward 135,000 tons, and in 1864 supplied Pittsburg with about 162,536 net tons, of 25 bushels each, of coal.

\* Pittsburg Quarterly Trade Circular for September, 1865.

Three collieries in the Alleghany valley, embracing 1,460 acres, sent to Pittsburg in 1862 53,018 tons, and in 1864 72,368 tons, or 1,809,200 bushels.

Thus the whole number of collieries tributary to the furnaces, forges, foundries, rolling-mills, machine-shops, glass-works, cotton-mills, flouring-mills, &c., and to the commerce of Pittsburg and its lines of communication, number at the present time, exclusive of several small ones around the city, about 103. They employ 6,424 hands, and for their transportation 21,258 cars, besides boats, barges, &c. The population of the several collieries is about 30,960, and the quantity of coal mined in 1864, exclusive of what was exported by the Pennsylvania railroad, was 48,462,966 bushels, of which Pittsburg consumed 18,921,399 bushels, and 29,541,567 was exported by the Ohio river. Averaging the price of coal consumed at Pittsburg at 12 cents a bushel, and of that exported at 20 cents, the value of the coal-trade of Pittsburg for 1864 would amount to \$8,168,880, and if to that be added the value of coke made in about 410 coke-ovens in the districts above mentioned, the value would be nearly \$9,000,000, a value exceeding the total product of bituminous coal returned in 1860 for the whole Union. These figures serve to show the value of this interest in an important portion of the bituminous coal-field of the United States, and the rapid development of the mining and manufacturing interests to which it is related. For shipment the coal is put on board the boats, barges, &c., for dealers, at a given price per bushel of 76 pounds, instead of by the ton. The quantity reaching the seaboard from the Allegheny coal-field is never large, much of it being taken up on the route, by the several towns and iron-works, and the coal of Virginia and Nova Scotia underselling it in the eastern markets. Small quantities are exported by the lakes from Erie.

The Maryland division of the field has been estimated to contain an aggregate of 550 square miles of bituminous coal, for which the internal improvements of that State and Virginia have opened a valuable trade with the seaboard cities. The Eastern Cumberland or Frostburg region, in Maryland, contains a productive coal-bearing surface of 135 square miles, or 86,847 acres, and an available quantity of upwards of 4,000,000,000 tons of coal, which in quality is intermediate between the fat bituminous coking coals of Pittsburg and the anthracites or non-bituminous coals. The experiments of Professor Johnson show that in evaporating power it holds the highest place among American coals, and hence is valued as a generator of steam for ocean steamers. Three working veins of this region, one of which is, in places, fourteen feet thick, and the others six and four feet, respectively, are capable of supplying 1,210 millions of tons. In 1820 about 7,000 bushels of semi-anthracite coal was mined in Allegheny county, Maryland, at a cost of  $6\frac{1}{4}$  cents a bushel, and a part of it was sent down the Potomac, in boats. In 1832, about 300,000 bushels were sent down the Potomac from Maryland, but little of which descended lower than Harper's Ferry.

The price of Cumberland coal at tide-water, in Georgetown, in 1838 was about 20 cents a bushel. The cost of mining was \$1 per ton, and of transportation by canal about \$2 85 per ton. The cost of both has since been reduced. In 1846 the toll on the Chesapeake and Ohio canal from Cumberland to Georgetown was half a cent a ton per mile. In 1848 the cost of transportation on the same was fixed at  $4\frac{1}{4}$  mills a ton per mile, and to Washington city in 1853 it was \$2 10 $\frac{1}{2}$  per ton for the whole distance.

The extent and growth of the Maryland coal trade, which is principally in the hands of the Cumberland Coal and Iron Company, having a large capital, as shown by the census returns, was, during the first 17 years, from 1842, as follows: In 1842 there was sent to market 1,708 tons; in 1843, 10,082 tons; in 1849, 142,449 tons; in 1853, 533,979 tons; and in 1858, 649,656 tons. The transportation of Cumberland coal from Baltimore and Alexandria employed in 1852 1,424 vessels.

In Virginia the bituminous deposits of the Richmond or Chesterfield coal basin, extending on both sides the James river from Petersburg to 15 or 20 miles above Richmond, were the first opened in this country, and afforded the only supply of domestic coal in the last century. It is said to have been first discovered by a boy while digging for cray fish. In 1789 coal was exported thence to Philadelphia and other eastern towns, and sold in the former place at 1s. 6d. a bushel. The superficial

area of this coal-field has been estimated at 185 square miles of productive coal land. At the eastern margin, where it has been chiefly worked, the dip of the seams is at an angle of 35°, and the workings have gone as deep as 800 feet, and others to 400 feet and upward. With one or two exceptions these deep mines are incommoded by water, and as the structure of the basin does not admit of adits for cheap drainage, the cost of pumping and of raising the coal makes the expense of mining much greater than in the Alleghany coal-field, which is above water-level. In 1836 it was stated that coal could be delivered at a profit in Richmond at 15 or 16 cents a bushel, and in 1838 it was said it could be supplied for national purposes at 10 cents on the north and at 12½ cents per bushel on the south side of the James, or at \$2 80 and \$3 50 per ton. In 1846 Richmond coal sold in Philadelphia at 20 to 22 cents a bushel, or 2 to 3 cents higher than Alleghany bituminous coal. In 1822 these mines produced for exportation 48,214 tons, and in 1833 142,000 tons, but in 1842 the quantity had declined to 65,750 tons. The average quantity for twenty years was 87,500, which cost for raising \$1 12 per ton, or 4 cents a bushel. In 1846 new mines at Clover Hill were opened to commerce by railway, which in 1847 furnished coal at the rate of 1,500,000 bushels or 53,500 tons per annum. The average annual importation of Virginia coal into Philadelphia from 1824 to 1829 inclusive was 4,143 tons, and into Boston from 1835 to 1841 inclusive, 5,805 tons. In 1848 Boston imported thence 183,352 bushels, and in 1850 63,417 bushels.

Small deposits of anthracite and semi-bituminous coal of little practical value occur in Virginia, which in 1840 produced 200 tons of anthracite. Bituminous coal and cannel coal is also found on the Kanawha, in West Virginia, and elsewhere in that State, and the latter kind in Kentucky, Pennsylvania, Indiana, and Missouri.

The importations of foreign bituminous coals from Great Britain and the British Provinces into Philadelphia, chiefly for the gas-works, amounted in 1833 to 3,018 tons, in 1838 to 9,792 tons, in 1850 to 7,698 tons, and in 1853 to 12,246 tons, at a duty after 1850 of 30 per cent.

The ANTHRACITE trade of the United States, confined chiefly to Pennsylvania, although small deposits of that mineral are found in Rhode Island, Massachusetts, Texas, and some other States, is at present the most important of the coal mining interests.

The northern or Wyoming anthracite region of Pennsylvania, embracing the districts of Schickshinny, Wilkesbarre, Newport, Pittston, Lackawanna, and Carbondale, and an area estimated at 120 square miles, or 76,805 acres, was the first in which this species of coal was observed and applied to practical purposes. As early as 1768, in the first settlement of the Wyoming valley, Obadiah Gore, of Wilkesbarre, an ingenious blacksmith, began to use it in his forge, and his example was followed by others of the trade. In 1788 Jesse Fell, of the same place, employed it in a nailery, and twenty years later contrived a grate for burning it as fuel in his house. In 1775 a cargo of this article was sent down the Susquehanna to Carlisle barracks. From 3,500,000 to 4,000,000 bushels had been shipped to the seaboard previous to 1829, when mining operations first commenced at Carbondale. This northern part of the district contains the hardest species of white-ash coal, and from this point to the Hudson a railroad was opened in that year. The Lykens Valley Company had mined about 60,000 tons during several years preceding 1841, when in the Wilkesbarre district operations were commenced by sending to market 32,917 tons. From 1829 to 1846 this whole region sent to market an aggregate of 3,732,686 tons, and from that period to 1853 6,826,637 tons, a total in twenty-four years of 10,559,323 tons.

The southern or Schuylkill coal-field, containing three principal basins and extending from the Lehigh on the east nearly to the Susquehanna on the west, comprises the Lehigh, Tamaqua, Tuscarora, Schuylkill valley, Pottsville, Minersville, Swatara, Lykens valley, Dauphin, and other districts. Its area of workable coal has been approximately computed at 164 square miles, or 104,960 acres. Anthracite was first accidentally discovered in this region on the Mauch Chunk mountain, in Carbon county, where the summit mines now are, by a hunter named Ginter. The specimen of "stone coal" was exhibited in Philadelphia, and in 1793 the "Lehigh Coal Mine Company" was formed to open a mine,

and took up several thousand acres where the celebrated Mauch Chunk mines are still worked as open mines. Though used in smitheries in that region, no coal was sent to market until 1806, when William Turnbull sent an ark-load of two or three hundred bushels to Philadelphia, which was bought for the Philadelphia Water Works. Through inexperience in its use it proved intractable as a fuel, and nothing was done until the war of 1812 rendered Virginia and British coals so dear that the proprietors opened a mine, which was again abandoned or leased on the return of peace. The difficulty of transportation was a principal obstacle to its use. Oliver Evans, of Philadelphia, in the year 1800, devised and patented a "luminous" grated stove, with talc light, with special reference to the use of mineral coal, but Dr. Thos. C. James was one of the first to use it habitually in his house, which he continued to do from 1804 to 1826. Some successful experiments in the use of anthracite in manufactures, made about the year 1812, at a rolling-mill in Delaware county, and at White & Hazard's wire-mill, on the Schuylkill, with a few loads of coal sent from the Centreville mines, in Schuylkill county, and sold for the cost of transportation, attracted attention to this species of fuel. In 1814 about 20 tons were received at Philadelphia from Mauch Chunk, by the Lehigh and Delaware rivers, at a cost of \$14 per ton. In 1820 the trade may be said to have opened by the arrival of 365 tons from the same place, which for five years furnished the only supply of hard coal. It was delivered at the doors of purchasers for \$8 50 per ton. In 1827 the Mauch Chunk railroad,  $9\frac{1}{2}$  miles from the summit to the Lehigh, was commenced and finished, and subterranean railways were at the same time extended into the "drifts," which, until 1834, were the only mode of mining in use. In 1825 the Schuylkill coal district was opened and sent down 6,500 tons, the whole quantity sent to market from both sources, which for four years more were the only sources of anthracite, being 34,893 tons. The Lehigh Coal and Navigation Company, formed in 1822 by the union of two other companies and incorporated in 1832, opened navigation in 1825 from Philadelphia to Port Carbon, 108 miles, at a cost of nearly \$3,000,000, and gave an impulse to the trade. The company worked the mines for a number of years. In 1839 the railroad was opened from Philadelphia to Reading, and in 1842 was completed to Pottsville, 93 miles, at a cost, including real estate, of upward of \$16,000,000. This rapidly developed the coal trade of that district, and in 1847 203,540 tons were received at Philadelphia by railroad and 226,610 tons by canal. New roads and canals have been built and old communications extended throughout this whole region and to various points of delivery. Coal was first sent from the Swatara district in 1834. From the opening of the trade in 1820 to 1848 the Lehigh district sent to market an aggregate of 5,505,327 tons, and the Schuylkill district, from its commencement in 1825 to the same date, 11,859,150 tons. In the second year of its trade the latter shipped 17,000 tons, and in 1830, 89,000 tons. Up to January, 1854, the Lehigh district had furnished 9,756,598 tons, and up to 1861, 18,198,788 tons of anthracite. The Schuylkill region at the last period had sent to market 46,503,794 tons. Schuylkill county in 1860 had 78 coal operators, and mined 4,134,637 tons annually, in about 113 collieries.

The middle anthracite region of Pennsylvania, a wild and broken country, extending from Shamokin to the Lehigh, is estimated to cover at least 115 square miles, or 73,000 acres of workable coal. Of this area the two large basins of Mahanoy and Shamokin, with a few minor ones, contain 75 square miles, or 48,000 acres, and the eastern group of 20 to 30 smaller basins, including Beaver Meadow, Hazleton, &c., the balance of 25,000 acres.

In an early provincial map of 1770 coal pits or mines are marked near the Mahanoy creek, above Crab run, in this region. But little or no mining was done in it until 1834, when only 500 tons were mined in this region, and hauled in wagons to neighboring districts. The Shamokin basin is one of the richest in the State, containing numerous large seams, of which the "mammoth vein" has a maximum thickness of 50 feet, and others 5 to 27 feet. From 1839, when a railway 16 miles in length was opened to Sunbury, on the Susquehanna, and the shipment of coal from Shamokin and Sugar Loaf mines began, down to 1847, inclusive, this district supplied 119,311 tons of white ash coal. From 1848 to 1853, inclusive, it supplied 124,262 tons. The iron works at Danville then required 200,000

tons of coal annually, which had been previously supplied from Wilkesbarre, 20 miles more distant. The Mahanoy district of this region contains the Girardville coal mines, the noble bequest of Stephen Girard to the city of Philadelphia. Mining operations commenced at Beaver Meadow about 1837, and during the next year a colliery was opened at Hazleton, where the deepest coal-shaft probably in the United States is now worked at the Sugar Loaf colliery, which has reached the bottom of the fourth lift, over 900 feet below the surface, by a slope 619 yards in length.

The aggregate quantity of anthracite sent to market from all sources in Pennsylvania, from 1820 to 1840, inclusive, was 6,847,172 tons, and in the next 7 years to 1847, inclusive, 12,371,961 tons; total, 19,219,133 tons. From 1848 to 1853, inclusive, it was 23,841,358 tons, making the aggregate to that date 43,060,491 tons. The increase in the 10 years from 1827 to 1837 was 1,735 per cent.; from 1837 to 1847, 240 per cent.; and in the 20 years from 1827 to 1847, 6,150 per cent.

The total production of anthracite returned by the census of 1840 was 863,489 tons, and the number of miners 3,043. Of bituminous coal, (returned in bushels,) the product was 985,828 tons, and the workmen numbered 3,768; total quantity of both, 1,849,317 tons and 6,811 miners.

The annual consumption of American anthracite in 1853 has been estimated by Professor Halde-  
man at 5,195,151 tons.

In the 29th annual report of the Philadelphia Board of Trade for 1862 the anthracite region of Philadelphia is, for commercial purposes, considered under two grand divisions—the northern and southern coal-fields. The southern field includes all the coal-basins south of the Nescopeck mountain, comprising the Schuylkill, Lehigh, Mahanoy, Shamokin, Wiconisco, and Swatara basins, with an area of 233 square miles, or 149,120 acres. The northern field includes the long canoe-shaped basin north of Wyoming mountain, with its centre near Pittston, the junction of the Lackawanna and Susquehanna rivers, by which, exclusively, it is watered. Its area is given as 178 square miles, or 113,920 acres.

The grand aggregate of hard anthracite coals sent to market from these two regions since the opening of the trade is there given as 97,924,969 tons. Of this quantity the Schuylkill and Lehigh districts, together, furnished 67,819,517 tons, and the Wyoming and Lackawanna region, 27,556,792 tons, while the Pine Grove and Shamokin mines sent down 3,191,604 tons. The total quantity sent from the southern coal-field by its several outlets, of which the principal were the Philadelphia and Reading railroad and the Schuylkill canal, was, in 1860, 5,482,979 tons, and in 1861, 4,785,375 tons. From the northern division, in the same years, were sent 2,817,957 tons in 1860, and 2,888,459 tons in 1861, making a total in the former year of 8,300,936 tons, and in the latter of 7,673,834 tons. The semi-bituminous fields of Broad Top, Blossburg, and Barclay, together, sent in the same years 313,142 and 426,255 tons.

The canal and railroad system, set in operation since 1821, for the development of the great carboniferous wealth of the anthracite coal-measures of Pennsylvania, embraced, in 1848, about ten different canals, with a total length of about 750 miles, and 25 lines of railroad, with an aggregate length within the State of about 1,000 miles, all having direct communication with the mines and constructed almost entirely with reference to the coal trade, at an aggregate cost to the State and to private enterprises of at least 45 million of dollars. The length of private railroads to the mines and under ground was 320 miles. Others, including several very important outlets, have been completed since that time. These have connected the several coal districts with the great chain of internal improvements in Pennsylvania, New York, and neighboring States, and have been a principal agency in the extension of the anthracite trade of the State. Baltimore is also connected with the coal region of Pennsylvania by a coal route between one and two hundred miles in length.

Among the causes which have contributed to build up the anthracite and bituminous coal trade of Pennsylvania and other States may be mentioned the vast consumption of coal-gas for illuminating purposes, and in smelting, and the direct substitution of raw coals for charcoal in the iron manufacture.

Inflammable gas was eliminated from mineral coal by Rev. Doctor Clayton, who wrote on America as early as 1688. It was first practically applied to purposes of illumination by Mr. Murdock, of Scot-

land, in 1797. In 1802 an Englishman, named Henfrey, patented in the United States a cheap mode of obtaining light from fuel, and proposed to light the city of Richmond and the United States light-houses with gas from coal. In September, 1815, two citizens of Georgetown took out patents for making light from stone-coal gas, and during the following year measures were taken in Baltimore, New York, Cincinnati, and Philadelphia, to illuminate the streets and private buildings with coal-gas, which Baltimore was probably the first to carry into operation for city use. From that time its use became general, and on January 1, 1862, the number of gas-works in the United States was 420, representing a capital of \$51,620,940. The consumption of coal by these works, chiefly bituminous and cannel coals, domestic and British, is enormous.

The generation of steam from anthracite was attempted in Philadelphia very early in the present century, but was first successfully carried into operation, it is believed, at Phoenixville, Pennsylvania, in 1825. For stationary engines and steamboats both anthracite and bituminous coals have been since used to a large amount, and more recently have been employed with encouraging success in locomotive engines for railroads.

An attempt was made many years ago at a small furnace in Plymouth county, Massachusetts, to smelt iron with raw anthracite coal, and in 1830 a furnace at Mauch Chunk was adapted to that kind of fuel from the neighboring mines. Success in this use of hard coal and the hot-blast was first measurably attained in this country at a furnace in Pottsville, Pennsylvania, built in 1837, and blown in on the 26th October, 1839, under the management of Mr. Perry, an experienced furnace manager, probably acquainted with the recent operations of Mr. Crane, of South Wales. The use of the blast-furnace, with anthracite, and the general adoption of Cort's puddling process in our rolling-mills, with the use of bituminous coal, gave a great impulse to the iron manufacture and to the demand for coals. The growth of Pittsburg, which had coal at its very doors, is very much due to this cause.

In 1845 there were in Pennsylvania and New Jersey 18 iron-works, having in blast 19 furnaces with anthracite, out of blast 4, and 10 others erecting. They produced annually about 57,000 tons of pig metal. Five other works, having 17 furnaces, including 12 in course of erection, chiefly in western Pennsylvania, used raw bituminous coal, including two very large rolling-mills. Several rolling-mills used anthracite almost exclusively in the processes of refining, puddling, heating, and reheating. Pig-iron could then be made with anthracite fuel, costing \$2 per ton, for \$15, and could be worked into common bar-iron for \$37 per ton. After many failures the use of anthracite appeared to be fully established in iron smelting and puddling, and has since been greatly extended. In 1847 the consumption of anthracite in the iron-works of Pennsylvania was 483,000 tons, worth on an average \$3 per ton; and of bituminous coal 9,007,600 bushels, worth 5 cents a bushel. In 1853, according to the publications of the American Iron Association, there were in the United States 121 anthracite furnaces in operation. The product of anthracite iron in the United States in 1849 was about 115,000 tons, and in 1854 307,710 tons, an increase of 200 per cent. in five years, or 22 per cent. per annum. In 1856 121 anthracite blast furnaces made 394,509 tons of anthracite iron, worth \$25 per ton, of which 306,972 tons were made in Pennsylvania. The product of raw bituminous coal iron in the latter year, by 19 furnaces, was 25,073 tons; and 24 furnaces made 44,481 tons of pig-iron with coke, which in its chemical character is nearly identical with anthracite. The production of charcoal pig-iron by 416 furnaces was 348,854 tons, worth \$30 per ton, a decline of 18,729 tons in that year.\*

The requirements of the Construction Bureau, for the use of the United States navy, of its vast workshops and other establishments during the late rebellion, and particularly in the last year, have vastly increased the production of coal in the loyal States, and rendered the mining interest unusually prosperous. We have no means of ascertaining the exact product of 1864. An internal revenue tax of 3½ cents per ton is now levied on all coals mined in the United States. The amount collected from this source for the year ending June 30, 1864, was \$572,436, of which sum \$437,192 was levied on the coal product of Pennsylvania. This would make the whole quantity of coal mined in that year 16,398,186 tons, and in Pennsylvania 12,491,219 tons.

\* Iron Manufacturers' Guide, by J. P. Lesley, Secretary of the American Iron Association.

The importations of foreign coals into the United States are made almost exclusively from Great Britain and the British Provinces, and notwithstanding the increased domestic supply, appear to be increasing. It is principally for the use of the gas-works of the Atlantic cities. In 1802 we imported from Nova Scotia 233 tons, and in 1846 95,330 tons, of bituminous coal. The total importations from abroad amounted in 1822 to 22,123 tons, and in 1839 to 181,551 tons. An increase of the tariff on coals in 1842 checked importations of this article, which in the next year amounted to only 41,163 tons. In 1847 it rose to 148,021 tons, of which 12,000 to 15,000 tons were re-exported for the use of English steamships. In 1850 we imported 180,439 tons, and in 1853 231,508 tons. For the year ending June 30, 1862, the quantity imported was 348,487 tons, valued at \$1,113,404.

Our exports of domestic coal in 1862 to all foreign countries were 213,046 tons, valued at \$837,117. In the years 1856 and 1858, respectively, we exported 677,420 and 558,014 tons of coal.

The duty on foreign coals, by the act of June, 1794, was 5 cents per heaped bushel, or about \$1 40 per ton. In May, 1824, it was raised to 6 cents a bushel, and in 1842 it was laid at \$1 75 per ton. In 1846 the duty was changed to an ad valorem one of 30 per cent., which rate in 1857 was reduced to 24 per cent. In 1862 a duty of \$1 10 per ton of 28 bushels was adopted. Under the treaty of reciprocity, coal to and from the British Provinces pays no duty.

A profitable field for invention and capital, in connexion with the mining of coal, lies open for the introduction of improved machinery and mining appliances both above and below ground, and in the more general resort to a regular system of mining, by shafts going down through all the strata of coal with gangs running into the several veins. The mode heretofore chiefly in use of mining by drifts and slopes, though less expensive at the outset, has often involved disappointment and ruin by the occurrence of faults or interruptions in the veins thus worked. Few if any mines in this country were sunk below water-level previous to 1836, and steam-engines were not much used before the introduction of coal-breaking machinery, about the year 1847. Now most of the mines go below water-level, and nearly all use one or more steam-engines, often of great power. Improvements are made almost daily, and many are required in this department of engineering and mechanics, in which the inventor of successful machinery, that will become generally available, holds the clue to a fortune. We are informed that a new mine, working a 40-foot seam of superior coal in Locust mountain, in the Mahanoy district, has in operation very perfect machinery, including a small locomotive engine to run in the gangways in the place of mules. Our coal deposits are practically inexhaustible, and there is little probability that the supply will materially exceed the future demand.

## IRON MINING.

Iron ore is widely distributed throughout the United States, frequently in close proximity to the deposits of fossil fuel in the coal-measures of the several States. A strict geological classification of these ores, or their precise geographical distribution, will not be required in this connexion.

Iron is found in the formations of every geological era, and the more recent the age in which they were deposited, as a general thing, the poorer and more earthy are the ores.

The primary rocks, for the most part, contain the magnetic and specular iron ores and the red oxide, generally in large masses, as in northern and western Canada, the Adirondack mountains of New York, the Blue Ridge and Black mountains of Virginia and North Carolina, in Wisconsin and Missouri. These ores have a crystalline structure and metallic lustre, and furnish 70 per cent. or upwards of the purest and richest iron, such as the Swedish and Russian.

In the secondary series of unchanged rocks are found the carbonate of iron, or spathic, sparry, or steel ore, from which German iron and steel are made. It occurs in large beds or layers, and is found in Connecticut and Vermont and some other States. To this formation also belongs the brown iron-stone, hematite or limonite, found in veins or lodes, seldom in masses, and, like the last, containing from 50 to 70 per cent. of iron. It is the source of the Salisbury iron of Connecticut, and similar deposits

occur in Massachusetts, Vermont, eastern New York, Kentucky, Tennessee, and Alabama, but especially in Pennsylvania, in rich and inexhaustible beds. Higher up in the coal-measures of this series the compact carbonate of iron, or clay iron-stone, is found in veins of greater or less extent, between beds of coal and limestone. It is the ore from which iron is principally smelted in England and Scotland, and yields 25 to 45 per cent. of metallic iron. It is widely distributed in the United States, especially throughout the anthracite, semi-anthracite, and bituminous coal areas of Pennsylvania, where it is often found imbedded with the coal itself. Western Maryland and Virginia, eastern Ohio, Kentucky, and Tennessee, northern Alabama, western Kentucky, southern Illinois, central Michigan, western Iowa and Missouri, and eastern Kansas, abound in this ore. It is better adapted to the cold than the hot-blast.

The ores of the tertiary period are the granular and clay ores and the bog iron ores of the present surface. Bog ore has, doubtless, been deposited in every age as a peroxide from ferruginous waters that have percolated beds of iron ore, and form, with earthy sediment and living organic matters, in low, moist places, considerable dome-shaped masses of wet and spongy bog, which, when drained, furnish a pabulum for charcoal furnaces. Along the southern lake shores, and in the coal-measures of Pennsylvania, Ohio, and other States, many furnaces have been run upon bog ores, of which the supplies have often failed. It is chiefly, however, in the cretaceous, tertiary, and drift formations of the Atlantic seaboard that the bog ores have been made available for iron-making. At the bottom of the numerous peat bogs, ponds, lakes, and swamps, along with sand, marl, and dead vegetable remains, the oxide of iron is deposited in crystallized honey-comb masses and nodules at the bottom, and in more fusible "loam" at the top, which when removed, are, in time, renewed again. From this ore, which yields 25 to 45 per cent. of iron, the first small charcoal furnaces in America were built in Massachusetts and other parts of New England, New Jersey, and Delaware, and made a poor quality of iron, suitable for castings, but not well adapted for forging.

These several kinds of ore are by no means limited to the formations indicated by the familiar geological terms used, but, with other varieties, occur more or less plentifully in each series of rocks.

We shall avail ourselves of the labors of the American Iron Association for the following synopsis of the more important iron regions of the United States, in relation both to the distribution of iron-works as they existed in 1858, and of the principal ores on the mining of which they were dependent for material:

"1. There is the iron region of New York, which formerly included Vermont, and makes its iron from primitive ores by means of 40 bloomaries and a few blast furnaces, three of which are now anthracite.

"2. There is the hematite and primary ore belt of the Highlands, beginning in western Massachusetts and running through northern New Jersey, into Pennsylvania, containing 44 charcoal and 22 anthracite furnaces and 60 forges, most of them making iron from the ore. Some of these works are of the oldest in the United States, and of revolutionary celebrity. Yet the region itself hardly holds its own, in spite of its admirable location, in the present condition of the manufacture, owing to its ruinous proximity to the seaboard ports, glutted as they are with foreign iron.

"3. Eastern Pennsylvania and northeastern Maryland is the greatest iron region in the Union, containing, as it does, 98 anthracite and 103 charcoal furnaces and 117 forges, none of which last produce iron from the ore. It is itself divisible into smaller areas with distinct geographical and geological limits, affording primitive and brown hematite ores, and in the centre lies its anthracite region of principal productiveness.

"4. Northern Virginia and northwestern Pennsylvania constitute together a fourth, much smaller iron region, with its coal-measure, carbonate ores, and its 42 furnaces and two or three forges. Its production in the tables (of the association) is accidentally increased by the circumstance that the great Cambria works, of Johnstown, have been built within its northern limits.

"5. Pennsylvania has still another and more important iron region in the northwest, including the northeastern corner of Ohio. Here 66 furnaces have been in blast, manufacturing iron from the burh-

stone and other carbonaceous ores at the northern outcrop of the great bituminous coal region. All the forging of this region is done in the rolling-mills and workshops of Pittsburg and other centres of trade upon the Ohio waters.

"6. The Iron-ton region, through which the Ohio river breaks above Portsmouth, contains 45 furnaces on the Ohio and 17 on the Kentucky side, some of which use the coal of the mine for fuel, and all of them the ores of the coal-measure for stock.

"7. The old iron-making region of middle and eastern Virginia, a prolongation of the Pennsylvania region, across the Potomac, supplied with the same brown hematite and magnetic ores, containing 16 furnaces in its division east of the Blue Ridge, only one of which is in blast, and 30 furnaces west of the Blue Ridge. It has also 35 forges.

"8. In the northern part of East Tennessee and northwest corner of North Carolina is seen a knot of 41 bloomy forges and 9 furnaces using the hematite and magnetic ores of the Highland range, while to the west of them, at the base of the Cumberland mountains and on the outcrop of the fossiliferous "dystone" ore of the upper silurian rocks, are 14 forges and 5 furnaces. In the southwestern corner of North Carolina are 5 forges of the same kind, and further to the east is a belt through the centre of North Carolina, passing over the line a few miles into South Carolina, consisting of 27 forges and 5 furnaces. There is also a small iron region in northern Georgia, along the line of the Chatahoochie, which passes over into Alabama. This whole country possesses an incalculable, inexhaustible abundance of the richest ores, while its production of iron still remains at a minimum.

"9. There is yet but one principal iron region in the far west, that of western Tennessee and western Kentucky, with its peculiar ores and 45 furnaces and 6 or 8 forges.

"10. In Missouri a beginning has been made with the Iron mountain as a centre, and there already exist 7 furnaces in blast upon brown hematite and primitive ores."\*

As an independent business, iron mining in the United States employed, in 1850, 197 establishments having an aggregate capital of \$923,775 and employing 2,195 persons. The annual cost of raw material was \$63,661 and of labor \$590,866, and the total value of the product was \$1,217,803.

On the 1st of June, 1860, the mining establishments numbered 157, and their combined capital was \$2,090,527, an increase of \$1,166,752. The annual expenditure for material amounted to \$249,699, and the wages of 3,177 hands employed to \$901,852. They raised 908,300 tons of ore, valued at \$2,182,667, an average of \$2 40 per ton. The increase of capital in this industry in ten years was 126.3 per cent., and the value of the product was increased 79.2 per cent.

Of the whole number of mining establishments 9 belonged to the New England, 143 to the middle, and 5 to the western States.

Of the three New England States from which returns were made, Connecticut had 5, Massachusetts 3, and New Hampshire 1 establishment. In Connecticut the invested capital amounted to \$111,000, and in Massachusetts to \$107,000, but the product of the latter was 30,000 tons of ore, valued at \$66,875, and in the former only 20,700 tons, worth \$40,625. The total capital of that section invested in iron mining was \$238,000, the number of hands 168, whose wages were \$43,428, and the product 51,700 tons, valued at \$121,500, an average of \$2 35 per ton.

The middle States, exclusive of Delaware, employed a capital of \$1,302,227 and 2,831 persons, whose annual wages cost \$794,224. The quantity of ore mined was 724,500 tons, worth \$1,667,067, or \$2 30 per ton. The mining interest of Pennsylvania was by far the largest, employing 112 establishments, with a capital amounting to \$804,727 and 1,876 hands, whose yearly wages cost \$472,024, the annual cost of raw material being \$106,878. The iron ore raised in the State was 508,100 tons, worth \$1,022,892, an average value of \$2 01 per ton. The quantity of ore mined in that State was more than one-half of all raised in the Union, but its value was somewhat less than half the total value. New Jersey was next to Pennsylvania in this industry, having 20 mining concerns whose investments amounted to \$359,000, the number of hands to 636, costing annually, for wages, \$232,020, and the

\* Iron Manufacturers' Guide.

# INTRODUCTION.

clxxvii

product 164,900 tons of iron ore, valued at \$481,750, an average of \$2 92 per ton. In New York there were 9 establishments, and in Maryland 2, of which the former mined 49,200 tons, worth \$156,675, and the latter 2,300 tons, valued at \$5,750.

In iron mining, Michigan ranked next to Pennsylvania in amount of capital employed, 3 establishments in that State having invested \$550,000. They employed 170 laborers, whose wages amounted to \$62,400 per annum. The ore mined in the State was 130,000 tons, worth \$390,000, or \$3 per ton, placing Michigan next to Pennsylvania and in advance of New Jersey in the value of iron ore raised in 1860. About 2,100 tons of ore were mined by 2 establishments in Ohio, which was the only other State from which returns were received of iron mining.

Many of the large iron-works of the country either own or farm the mineral lands and mine their own ore, which is not included in the foregoing product. The quantity thus raised in 1860 amounted to about 2,309,975 tons, which, added to the product of regular mining establishments, makes the total quantity raised in 1860 3,218,275 tons. At an average price of \$2 40 per ton, the total value would be \$7,723,860.

# INTRODUCTION.

## IRON AND IRON-MANUFACTURES.

### IRON BLOOMS.

The number of bloomy forges in 10 States on the 1st of June, 1860, was 97. Their aggregate capital was \$2,135,600, and the number of persons employed was 1,746, whose labor cost \$532,652, and the materials consumed were valued at \$110,889. The total weight of blooms made was 51,290 tons, valued at \$2,623,178, an average value of \$51 14 per ton.

Of the whole number of forges Pennsylvania contained 57, and produced 24,700 tons of blooms, worth \$1,467,450, which was upward of one-half the total value; and New York, in 24 bloomaries, manufactured 17,536 tons, valued at \$697,198, which was over one-fourth of the whole value produced in the Union. Vermont was the only New England State which reported bloomy forges, of which there were 3, producing 1,400 tons, worth \$54,000. Tennessee had the same number, and ranked next to the two States first named in the quantity of blooms made, which was 4,486 tons, worth \$251,580. In none of the other States did the product exceed \$50,000 in value. In New Jersey there were 5 small bloomaries, and in Maryland, Virginia, Ohio, Kentucky, and Missouri, 1 each.

*Statistics of iron bloom produced during the year ending June 1, 1860.*

\* Also 250 tons produced in a rolling-mill.

### PIG-IRON.

The iron furnaces in 21 States in 1850 were 404. They employed an aggregate capital of \$16,648,360, and 21,054 persons, including 207 females. They consumed about 1,579,309 tons of ore, and produced about 564,755 tons of pig-iron, valued at \$13,491,898, an average of \$23 43 per ton.

In 1860 returns of pig-iron were made by 286 establishments, in 18 States, in which the total capital invested was \$24,672,824, the number of hands, including 73 females, 15,927, and the cost of labor \$4,545,430. They smelted 2,309,975 tons of ore, costing with other materials \$12,293,030, and made 987,559 tons of pig metal, worth \$20,870,120, or \$21 13 per ton, an increase of 422,804 tons of pig, and of 54 per cent. over the value of the manufacture in 1850.

The business employed, in three New England States, 14 establishments, which with 786 hands manufactured from 72,800 tons of ore, 26,600 tons of pig-iron, valued at \$814,000, an increase of 9 per cent., and equivalent to \$30 60 per ton. From New Hampshire, in which 1 furnace, in 1850, made pig-iron of the value \$17,200, there was no return in 1860. The State of Massachusetts, with 5

furnaces, produced the largest amount, having increased its product 49 per cent., while Connecticut, with 7 establishments, scarcely held its own, and Vermont, with 2 furnaces, showed a considerable decrease from the value in 1850.

In the four States of New York, Pennsylvania, New Jersey, and Maryland, the number of establishments fell off from 235 to 157, but in all, except the last mentioned, showed a large increase in the capital and value of the manufacture since 1850. The furnaces in these States employed a capital of \$15,799,744, and 9,385 persons, including 4 females. From 1,689,550 tons of ore smelted they produced 736,869 tons of pig-metal, valued at \$14,654,962, an increase of \$5,872,961, or 66.9 per cent. in the value of the product, and an average of \$19 88 per ton for the iron.

Pennsylvania, which is the principal iron-producing State in the Union, numbered 125 establishments, which was 43 less than were reported in 1850. Of the total capital employed in this branch of production in the United States, upward of one-half, or \$12,723,644, belonged to that State, in which the number of hands was 7,593. The weight of pig-metal made from 1,351,000 tons of ore was 580,049 tons, worth \$11,262,974, or \$19 41 per ton, an increase of \$5,092,349, or 82 per cent., over the value made in 1850. The product was nearly 54 per cent. of the total value made in the Union, and nearly 75 per cent. of the quantity produced in 1860. In New York the product of pig-iron was augmented at the rate of 53 per cent., 15 furnaces having made 74,645 tons, worth \$1,635,758, an average of \$21 91 per ton; and New Jersey, in 6 establishments, made 51,675 tons of pig-metal, worth \$1,016,630, or \$19 67 per ton, an increase of 105 per centum in ten years. The value of 30,500 tons of iron made by 11 furnaces in Maryland averaged \$24 25 per ton, the whole value being \$739,600, or \$308,650 less than the value in 1850.

From 7 western States returns were made of 76 pig-iron furnaces, aggregating a capital of \$6,223,000 and 4,021 hands. They consumed 456,127 tons of iron ore, producing 187,300 tons of metal, worth an average of \$23 74 per ton, or \$4,447,255, which was an increase of 75 per cent. The States of Ohio and Kentucky were the principal producers. The first-named State employed in its iron furnaces an aggregate capital of \$3,654,000 and 3,119 persons, and from 288,977 tons of ore made 117,754 tons of pig-metal, valued at \$2,697,366, which was equal to \$22 90 per ton, and an increase of 88 per cent. in ten years. In Kentucky \$1,520,000 was invested in iron furnaces, which employed 465 men and smelted 98,750 tons of ore, producing 33,471 tons of iron, worth \$804,214, or \$24 02 per ton, an increase of over 27 per cent. In Michigan, which had 4 furnaces; in Missouri, with 2; and in Wisconsin, with 2 furnaces, the increase was large, while in Indiana and Illinois, with 1 establishment each, the falling off in the product was large.

Returns were made of 39 establishments in Virginia, Georgia, Alabama, and Tennessee, in 1860; the two Carolinas, which, in 1850, returned a value of \$44,400, reporting none at the last census. In the first-mentioned southern States the total capital amounted to \$1,934,080, and the number of persons employed to 1,735. The quantity of ore smelted was 91,498 tons, the weight of pig-iron made was 36,790 tons, valued at \$953,903, an average of \$25 92 per ton, and a decrease from the total value made in 6 States in 1850 of \$469,632, or upward of 14 per cent. The State of Tennessee was the largest producer of pig-iron in the south, its furnaces numbering 17, with a capital of \$1,062,675 and 991 male and 60 female hands, who produced, from 56,969 tons of ore, 22,302 tons of metal, valued at \$549,640, or \$24 64 per ton, a decrease from the product of 1850 of \$183,050, or 13.3 per cent. In Virginia, 16 furnaces, employing 529 persons, also showed a considerable falling off in the product of pig metal made, which amounted, in 1860, to 11,646 tons, worth \$538,249, or \$26 46 per ton. The decrease in Georgia, which had 2 furnaces, was upward of 50 per cent., and in Alabama, with 4 establishments, it was increased from \$28,896 to \$64,590. The value per ton in the two States last named was \$28 63 and \$37 07 per ton, respectively, the latter being the highest average value of pig-iron reported from any State, and \$5 84 per ton above the average price in all the States.

## BAR, SHEET, AND RAILROAD IRON.

In 1850 the number of forges returned was 375, and of rolling-mills 64. The capital employed by the former was \$8,517,011, and by the latter \$5,214,700, a total of \$13,731,711. The forges employed 7,775 persons, and the rolling-mills 3,829, in all 11,604, whose aggregate wages was \$3,762,508, the cost of material in both branches being \$9,691,655. The product of the forges was a value of \$9,002,705, and of the rolling-mills \$6,936,081, making a total of \$15,938,786.

The number of establishments employed in 1860 in 20 States in producing bar, sheet, and railroad iron, was 256. Their aggregate capitals amounted to \$19,924,473; the number of persons employed to 19,262; the cost of wages to \$6,514,258; and of materials to \$19,242,743. The materials included 656,803 tons of blooms, pig-metal, and ore, from which were made bar and other iron of the aggregate value of \$31,888,705, an increase of 100 per cent. on the product of 1850. This sum comprised the values of 227,682 tons of bar-iron, 30,895 tons of boiler and nail-plate, 11,200 tons of sheet iron, and 4,200 tons of wire-rods, tire and other iron, a total weight of 513,213 tons, of the average value of \$62 14 per ton. In addition to the foregoing, there were also produced, in the same establishments,

2,956 tons of nails, 660 tons of spikes, 210 tons of rivets, 115 tons of anchors, and 250 tons of blooms, and some machinery.

In the eastern States there were 14 establishments, (one-half of them in Massachusetts,) which, with a capital of \$1,293,000 and 1,298 hands, made from 61,895 tons of raw material, 50,590 tons of bar, railroad, and other iron, valued at \$3,361,400, an average of \$66 44 per ton, and an increase of 84.1 per cent. on the product of New England in 1850. The product of Massachusetts was 40,925 tons, worth \$2,634,000, an average price of \$64 36 per ton, and an increase of 277 per cent. on the product of that State in 1850. Included in that amount were 24,000 tons of railroad and 9,425 tons of bar-iron. Maine produced only bar-iron, beside nails and rivets—the former amounting to 5,100 tons, made in one establishment, and valued at \$63 per ton. The increase of the manufacture in Maine was 152 per cent., while in Vermont and Connecticut there was a decrease; and from New Hampshire there were returns of 70 tons of iron rails inserted by mistake in the table of iron railing.

The manufacture of bar, sheet, and railroad iron, &c., in the middle States employed 134 establishments, having, collectively, a capital of \$13,627,863, or nearly as much as was employed in all the States in 1850. They wrought up 437,850 tons of blooms, pigs, &c., costing, with other materials, \$12,071,969, and employed 13,151 persons, at an annual cost for labor of \$4,330,848. The value of the iron produced was \$20,040,336, which was an increase of 85 per cent. upon the value made in these States in 1850, and \$4,101,550, or upward of 25 per cent. in excess of the total product of the United States in that year. The whole weight of iron manufactured was 346,969 tons, at an average price of \$57 70 per ton. This quantity consisted of 154,297 tons of bar, 158,577 tons of rails, 22,795 tons of boiler and nail plate, 10,000 tons of sheet, and 1,300 tons of other iron, in addition to some anchors and blooms.

Pennsylvania and New York were the largest producers, the former having 87 and the latter 10 establishments. The capital invested in this branch of the iron trade in Pennsylvania amounted to \$10,974,013, or more than one-half that of all the States. The business employed 10,177 persons, whose labor cost \$3,283,536, the cost of materials, including 330,987 tons of crude iron, being \$8,862,947. The value of the product in that State was more than doubled, and amounted to \$15,122,842, the rate of increase being 106 per cent. It fell short of the value made in the United States in 1850 in the sum of only \$815,944. Comprised in the manufactures were 112,276 tons of bar-iron, 133,577 of railway iron, 13,000 tons of boiler plate, &c., 7,000 tons of sheet iron, and 400 tons of galvanized iron, a total of 266,253 tons, of the average value of \$56 80 per ton. Of the whole value, \$3,761,683 was made by 13 mills in Pittsburg. The quantity of iron made in New York, including 22,825 tons of bar, 14,000 tons of rails, and 1,450 tons of nail-rods, was 38,275 tons, worth altogether \$2,251,250, an increase of 19 per cent. on the product of 1850, and an average value of \$58 81 per ton. In its production were employed a capital of \$939,750 materials, including 50,650 tons of raw iron and ore, of the value of \$1,529,833, and 1,473 hands, whose labor cost \$514,680. In New Jersey there were 26 establishments, employing a capital of \$1,098,100, and 963 persons. They consumed 39,990 tons of material, from which were made, besides 115 tons of anchors, 29,186 tons of iron, including 900 tons of iron wire, the whole valued at \$1,617,519, an average of \$55 20 per ton, and an increase of 43 per cent.

The iron mills in Delaware numbered 4, and in Maryland 7—the former producing 2,570 tons of bar, plate, and sheet iron, worth \$192,600, an increase of 230 per cent.; and the latter 10,685 of bar and sheet iron, in addition to 250 tons of blooms, the whole valued at \$856,125, an increase of 104 per cent. in ten years.

The western States contained 24 manufactories of bar and rolled iron, of which 13 were in Ohio, 5 in Kentucky, 2 in Missouri, 2 in Indiana, and 1 each in Michigan and Illinois. The total amount of capital invested in this industry in the west was \$3,370,300, and it gave employment to 2,804 persons, at an annual cost of labor of \$1,097,160. The consumption of pig-iron, blooms, &c., was 113,374 tons, valued, with other articles, at \$776,250, and from it were manufactured 41,973 tons of bar-iron, 40,000

tons of rails, 2,100 tons of plate iron, and 1,200 tons of sheet iron, a total weight of 85,273, of which the value, including 2,000 tons of nails and spikes made in Ohio, was \$6,028,850, an increase of 234 per cent., and an average value per ton of \$69 10. More than one-half of the product in that section was made in Ohio and Kentucky, the former having 13 and the latter 5 iron mills. In the extent of its iron trade Ohio is, next to Pennsylvania, the largest in the Union, having, in 1860, returned a larger value than either New York or Massachusetts. In the State was employed a total capital of \$961,800 and 1,326 hands, who used up 58,270 tons of pigs, valued at \$1,719,798, and produced 20,495 tons of bar-iron, 19,000 tons of railroad, and 1,200 tons of plate iron, a total of 40,695 tons, worth, with 1,500 tons of nails and 500 tons of spikes made, \$2,806,200. The increase was 173 per cent.

In Kentucky a larger capital was invested than in Ohio, or \$1,350,000, but the weight of material rolled was only 16,850 tons, which made 14,000 tons of bar, plate, and sheet iron, worth \$1,183,150, an increase of 68 per cent.

One mill in Illinois produced 12,000 tons of rails, worth \$660,000; one in Michigan, 9,500 tons of bars and rails, worth \$585,000, being the first returns of rolled iron made from these States.

In Missouri the product was largely increased over that returned in 1850, and amounted to 6,678 tons, valued at \$670,000, while 2 mills in Indiana reported 2,300 tons of bar-iron and rails, worth \$124,500, against a value of \$4,000 in 1850.

The southern States contained 84 iron mills, employing about one-half as much capital as the western establishments, viz: \$1,633,010, and made from 43,684 tons of crude iron and ore, which, with other materials, cost \$1,294,104, by the labor of 2,009 persons, 26,252 tons of bar and railroad iron, valued, with some nails, spikes, and machinery, at \$2,458,119, or \$91 52 per ton. The increase in that section was 63 per cent.

The State of Virginia produced the largest value, having 20 establishments, with 1,382 hands, and a capital of \$1,047,725, which wrought 29,167 tons of material into 7,709 tons of bar and 10,180 tons of rails, valued, with 160 tons of spikes and some machinery, at \$1,666,885. The increase was 194 per cent.

Thirty-five mills in Tennessee consumed 8,181 tons of material, making 5,144 tons of bar-iron, valued at \$543,398, or upward of \$105 per ton. The product was a decrease from that of 1850. In North Carolina 25 small mills made 1,096 tons of bar-iron, worth \$99,656; and 2 in Alabama made 93 tons, worth \$8,550, which was also a decline in these States from the values returned in 1850. Two iron mills in Georgia made 2,030 tons of iron, chiefly rails, worth \$139,630, showing an increase in that State. In South Carolina, from which none was reported in 1850, 275 tons of bar-iron were made and returned as iron castings in the statistics of which it is included.

# INTRODUCTION.

MISCELLANEOUS.—2,894 tons nails, 600 tons spikes, 210 tons rivets, 115 tons anchors, 250 tons blooms and machinery.

a 70 tons of "iron rails," made in this State, were erroneously included with "iron railings."  
 b Nail plate.  
 c Wire rod.  
 d Bolter.  
 e f Galvanized.  
 g Exclusive of 4,128 tons in South Carolina.  
 h 275 tons of "bar-iron," made in this State, were returned and included with "iron castings."

## INTRODUCTION.

## IRON WIRE.

Wire-drawing, in 1860, employed 16 establishments in five States, having invested the sum of \$556,063, and employing 629 males and 28 females, whose wages cost \$240,960, the cost of materials being \$886,645 annually. Including 900 tons made by 1 mill in New Jersey and embraced in the statistics of bar-iron, the whole weight of wire made was 10,670 tons. The value in the other States was \$1,643,857, whereof \$1,237,600 was the value of 7,015 tons made by 9 mills in Massachusetts, employing 481 men and 28 females. Five of these were in the city of Worcester, where the value made was about \$940,000. One establishment in that place, founded in 1831, employed 2 mills with patent wire-drawing machinery and processes for producing all kinds of round, flat, or oval iron and steel wire, plated and galvanized wire, &c., for pianos and other musical instruments, needles, screws, springs, and machinery, covered wire for crinolines, bonnets, &c., and telegraph wire.

Four wire-mills in New York made 1,080 tons of wire, worth \$175,550, and 1 large establishment in Pennsylvania, with a capital of \$139,063, made 1,300 tons, worth \$178,957. A wire-mill in Ohio drew 300 tons of wire, worth \$39,000, and 1 in Virginia 75 tons, valued at \$12,750.

WIRE ROPE has been made for some years past by Mr. John A. Roebling, at Trenton, New Jersey, and in 1860 he employed a capital of \$100,000 and 30 hands, producing rope of the value of \$70,000 annually.

*Statistics of iron wire produced in the United States during the year ending June 1, 1860.*

STATES.	Number of establishments.	Capital invested.	Cost of raw material.	NUMBER OF HANDS EMPLOYED.		Annual cost of labor.	Annual value of products.	Tons of iron wire.

\* One rolling-mill, in Trenton, New Jersey, made 900 tons of wire, the product of which is included in "bar-iron," &c.

## IRON FORGING.

The several branches of iron forging employed 56 establishments, with a capital of \$1,362,650 and 1,049 hands, producing articles of the value of \$1,907,460.

Forged iron-work of a general character, including iron shafting made by one establishment in Massachusetts to the value of \$86,500, employed 33 establishments, with a total product of \$1,501,701, of which \$708,500 was produced by 7 in Massachusetts, exclusive of the one above named, \$253,500 by 12 in New York, \$102,250 by 3 in Pennsylvania, and \$160,000 by 1 large one in New York.

Twelve ANCHOR forges, in five States, produced a value of \$148,200, of which sum \$82,200 was turned out by seven forges in Massachusetts. Each of the States of Connecticut, New York, and New Jersey contained 1, and Kentucky 2 anchor works.

AXLES were also forged to a greater or less extent in five States, in which were 11 establishments with 156 hands, producing annually a value of \$257,559. The principal axle-works were in Connecticut, where 4 shops produced a value of \$165,000; 3 in Pennsylvania, a value of \$58,050; and 2 in Delaware. \$15,650; 1 in Maryland, about the same amount; and 1 in Massachusetts, \$3,000.

## CAR-WHEELS

Were made in 17 establishments, returned from 7 States, to the value, annually, of \$2,083,350, which was the value of 142,000 car-wheels, including 7,000 wheels, valued at \$87,000, cast in a shop at Worcester, Massachusetts, and included in the statistics of iron castings. The average value was \$14 67 each. In addition to the wheels made at Worcester, which are somewhat celebrated, being made of cold-blast charcoal iron and chilled in sand-pits, a large locomotive establishment at Taunton, in the same State, manufactures its own car-wheels, chiefly of the tubular kind. But the principal car-wheel factories are in the middle States.

Five establishments in the State of New York, at Troy, Albany, Rochester, and Buffalo, made 30,000 car-wheels, averaging nearly 5 to the ton, and valued, altogether, at \$386,550. Four establishments in New Jersey, three of them in Jersey City and one in Warren county, turned out 18,000 car-wheels, worth \$271,800. Three factories in Pennsylvania employed a capital of \$503,700 and 121 persons, and made 45,000 car-wheels, valued at \$613,000. The principal one at Philadelphia employed a capital of \$490,000 and 100 hands, and manufactured 24,000 car-wheels, which were cooled by a patent process, and valued at \$270,000, beside 725 axles, worth \$80,000. One factory at Hawley, in Wayne county, made 20,000 wheels, worth \$250,000, and one in Columbia county, 1,000 wheels, valued at \$13,000.

The largest car-wheel factory in the United States was at Wilmington, Delaware, and had invested a capital of \$200,000. This celebrated foundry consumed 10,000 tons of iron, and with 200 hands cast 30,000 car-wheels, valued at \$500,000, besides 1,000 chilled tires and 300 tons of other castings—a total value of \$562,000.

An establishment at Cincinnati, with 20 hands, made 1,200 tons of car-wheels, (about 6,000,) valued at \$75,000, and one at Chicago, 1,000 tons of car-wheels, or 4,000 in number, worth \$56,000.

*Statistics of car-wheels produced in the United States during the year ending June 1, 1860.*

STATES.	No. of establishments.	Capital invested.	Cost of raw material.	No. of male hands employed.	Annual cost of labor.	Ann. value of product.	No. of wheels made.

\* Number of wheels estimated.

## IRON CASTINGS.

The number of iron foundries in the United States in 1850 was 1,319, returned from 29 States. They employed a capital of \$14,722,749, and 18,969 persons, including 31 females, producing an aggregate value of castings, exclusive of stoves and ranges, of \$20,111,517, each of five States producing one million and upward.

IRON CASTINGS, exclusive of stoves, ranges, iron railings, and car-wheels, were made in 1860 by 955 establishments, in 32 States, and employed an aggregate capital of \$13,890,512 and 15,225 persons, of whom 11 were females. The value of the castings made was \$20,000,267, an amount nearly equal to the value of all castings, except stoves, made in 1850. Of a total product of \$4,202,690 by 173 foundries in New England, upwards of one-half, or \$2,158,935, was made in Massachusetts, where it has been a prominent industry for nearly a century past. Of 443 establishments in the middle States, 195 in New York produced a value of \$4,342,244; 170 in Pennsylvania, the value of \$3,125,684. Much of the value in the latter State was made at Pittsburg, which contained 17 or more iron foundries. Fifty establishments in New Jersey reported a value of \$2,198,531, and 24 in Maryland a value of \$772,825, including some bar-iron made. In Delaware there were 4 foundries, and in the District of Columbia 2. More than one-half the value made in the western States was the product of 67 foundries in Ohio, which reported castings made to the value of \$1,588,560. In Illinois 28 foundries made castings worth \$516,280. The value in all the other States fell below half a million each.

Virginia returned castings made by 54 foundries to the value of \$621,025. In each of the States of Tennessee, Louisiana, Georgia, and Mississippi, which ranked next, the value was below \$200,000, and in North Carolina amounted to \$61,100. In the remainder it was less than \$40,000 each. One foundry in Washington Territory, with 4 hands, produced \$10,000 worth of castings.

STOVES AND RANGES were made in 1850 by 230 foundries, in 13 States, to the value of \$6,124,748.

In 1860 stove castings alone employed 290 establishments, in 15 States, and 8,066 hands, which produced a value of \$10,709,972, an increase of \$4,585,224, or 74.8 on the above product. Of these establishments 40 in New England returned \$1,141,130, of which Massachusetts produced the value of \$617,470, exclusive of \$76,000 worth of stoves and ranges made in general iron foundries, and included with "iron castings." There was a falling off in that State from the product in 1850. Six foundries in Maine increased the value of castings made from \$18,000, in 1850, to \$111,760, and 4 in Rhode Island reported a value of \$259,000, against \$3,800 in 1850. The value of stoves made by 196 establishments in the middle States was \$7,162,132, of which sum 86 foundries in New York produced \$4,563,560, an increase of upward of 100 per cent. In that State 2 were exclusively devoted to making "hollow-ware," which was made to the value of \$113,000. In New York city and vicinity there were 23 foundries for stoves, in Albany 7, and in Troy 8. Both the last-named cities exceeded one million dollars in the value of stoves made, and are widely celebrated for their stove castings.

In Pennsylvania 107 stove and hollow-ware foundries returned a value of \$2,526,685, an increase of nearly 100 per cent. Of these, Philadelphia contained 45 and Pittsburg 5 stove and range factories. The value made in New Jersey was \$71,887, exclusive of some stoves made in that State, and, as in other States, returned simply as "castings." The value of stoves made in Maryland is included with iron castings, and amounted probably to \$125,000. One large foundry made 7,500 stoves, and another stoves and hollow-ware to the value of \$50,000. The value in 1850 was \$665,000.

In the western States there were 51 stove foundries, reporting a value of \$2,368,610, of which sum 39 in Ohio made \$1,074,650; 4 in Missouri, \$810,960; 3 in Kentucky, \$294,000; Illinois, a value of \$129,000, and Indiana of \$60,000. Tennessee was the only southern State which made a return of stoves cast, of which the value was \$16,500; and one foundry in California turned out a value of \$21,600.

HOT-AIR FURNACES AND COOKING RANGES were manufactured in 4 States, by 37 establishments, to the value of \$788,288, of which sum 11 foundries in Massachusetts produced the value of \$306,250, and 22 in Pennsylvania \$361,838; two in New Jersey reported a value of \$81,200, and 2 in Ohio \$39,000.

IRON RAILING employed 88 factories in 15 States, in which the value of railing made was \$1,706,356. Of these establishments 14 were in New England and 10 in Massachusetts, the latter producing a value of \$108,460; and Maine, New Hampshire, and Connecticut the balance of \$181,705 made in that section. Fifty-two foundries in the middle States reported \$1,135,206 worth of iron railing made, whereof \$854,750 was the product of 36 factories in New York, and \$232,853 of 12 in Pennsylvania, chiefly in Philadelphia. Three in New Jersey made a value of \$44,000. The western States made railing valued at \$324,445 in 18 foundries, of which 11 in Ohio turned out \$189,485, and one in Kentucky \$120,000.

Louisiana and Tennessee each contained 2 railing factories, making, respectively, \$65,000 and \$55,000 worth of railing.

MALLEABLE IRON CASTINGS.—Malleable cast-iron, which, by a modification of the annealing process, is made to combine the tenacity of wrought-iron with the cheapness of ordinary cast-iron, and less liability to oxidation, was first made at Newark, N. J., about the year 1828. In 1831 Seth Boyden, of that place, took out 2 patents for making it. In 1860 26 establishments, in 5 States, manufactured various articles of ironmongery, domestic, and other hardware, &c., to the value of \$930,800, of which amount \$333,500 was the product of 7 factories in New Jersey, 6 of them in Newark, where the value made was \$193,500. Eight establishments in Connecticut reported a value of \$276,500, principally made by 6 foundries in New Haven. There were others at New Britain and Meriden. Five malleable cast-iron foundries in New York returned a value of \$161,800, made chiefly at New York city, Troy, Watervliet, &c. Three foundries in Pennsylvania produced \$80,000; 3 in Massachusetts, \$79,000, of which \$38,000 was by 1 in Worcester. Malleable cast-iron guns were first made in the United States by Cyrus Alger, in South Boston, in 1836.

**MACHINERY, STEAM-ENGINES, &c.**

Machinists' and millwrights' work, in 1850, employed 1,061 establishments in 29 States, and the labor of 27,892 hands, producing a value of \$27,998,344.

In 1860 the same branch, exclusive of cotton and woollen and other special machinery, employed in 35 States and districts 1,173 manufactories, with an aggregate capital of \$33,319,080 and 37,370 hands. The value of steam-engines and machinery made was \$46,644,586, an increase of \$18,646,132, or 66.6 per cent. on the value returned in 1850.

The principal increase was in the middle, western, and southern States, and amounted, in the first, to \$5,341,426, or 36.8 per cent.; in the western States, to \$7,875,982, or 217 per cent.; and in the southern States, to \$4,907,241, or 5.88 per cent. over the values made in these sections, respectively, in 1850. New England decreased its production, and the Pacific States returned, for the first time, a value of \$1,500,000. Maine and Vermont were the only New England States showing an increase, while in Massachusetts the value fell off nearly \$2,000,000.

The middle States numbered 426 establishments, of which 184 were in New York, 166 in Pennsylvania, and 50 in New Jersey. The western States contained 329 factories, of which 133 were in Ohio; the southern States 115 establishments; and the Pacific States 28.

Of special machinery, the following were the principal branches:

**COTTON AND WOOLLEN MACHINERY**—192 establishments; capital employed, \$2,422,088; number of hands, 4,813; value of product, \$4,902,704.

**HAY AND COTTON PRESSES** were made by 2 establishments to the value of \$31,000.

**PAPER MACHINERY** employed 3 factories and 33 hands, producing a value of \$41,400.

**RIBBON LOOMS** were made by one establishment to the value of \$15,000.

**SHINGLE MACHINES** employed 5 factories and 13 hands, with a product of \$10,620.

**SILK MACHINERY** was made by 2 establishments, having 17 hands, to the value of \$12,756.

**STAMP MACHINES** were produced by one firm to the amount of \$7,210.

**TURBINE WATER-WHEELS** employed 2 factories with 50 hands, turning out a value of \$96,700.

**WOOD-WORKING MACHINERY** was made by 2 establishments at Worcester, Massachusetts, having a capital of \$34,000 and 78 hands, whose labor produced a value of \$135,000, including several kinds of planing machinery, &c., &c.

**MACHINISTS' TOOLS** employed 17 manufactories, a capital of \$536,150, and 455 hands, and the value of the manufacture was \$540,292, of which \$205,000 was the product of one establishment in Philadelphia, having a capital of \$280,000 and employing 190 hands, and turning out machinists' tools of acknowledged excellence. Nine establishments in Massachusetts reported a value of \$165,600 made, and 2 in New Haven, Connecticut, a product of \$71,600. Three in New York, made tools of the value of \$47,950; 1 in New Jersey, \$2,800; and 1 in Delaware, \$22,142.

**LOCOMOTIVES.**

Locomotive engines were manufactured in 7 or 8 States, to the number of 470, or upward. The number of establishments engaged wholly or chiefly in this branch of machinery was 19, which, together, employed a capital of \$482,592 and 4,174 hands. The value of the engines made was \$4,866,900, an average of \$10,355 each.

The largest value was made by 4 manufactories in New Jersey, from which were turned out 166 locomotives, valued at \$1,565,000, of which sum \$765,000 was the product of one of three factories at Paterson, which employed 720 men and built 90 locomotives. The next in size was also largely engaged in making cotton machinery. The fourth shop was that of the Camden and Amboy Railroad Company, at Bordentown, which made a few engines and a number of cars.

Next to New Jersey, came Pennsylvania, in which 2 large factories in Philadelphia, among the oldest and largest in the country, employed capitals, respectively, of \$900,000 and \$750,000. The

largest, with 675 hands, constructed 89 engines, worth \$750,000, and the other, with 580 men, turned out 79 locomotives, valued at \$670,000. Two locomotives were built in Scranton, and two in Pottsville, the values of which are not included in the statistics of this branch.

Five locomotive shops in Massachusetts built 54 engines worth \$643,000. The two largest were at Taunton, one of which, with 175 hands, built 23 locomotives valued at \$180,000, and the other, with 425 men, made \$250,000 worth of cotton machinery and 14 complete locomotives, including the wheels, and valued at \$80,000. Others were manufactured at Worcester and Roxbury.

Four shops in New Hampshire constructed 43 engines valued at \$805,900. The largest were 2 at Manchester, one of which, the machine department of the Amoskeag Manufacturing Company, employed 450 men, and turned out 37 locomotives, valued, with mill machinery and castings, at \$695,000. The Manchester Locomotive Works, formerly extensively engaged in the business, built about 5 engines, worth \$37,500, and the railroad shop, at Lake Village, a few locomotives and 32 cars. Another repaired engines and built 70 cars.

An old locomotive establishment at Baltimore, not in full operation in 1860, built in that year about 6 engines, worth \$50,000. Two railroad shops in Kentucky executed work of the value of \$250,000, of which \$235,000 was the value of about 10 locomotives, some cars and repairs, made by one, and the balance chiefly repairing by the other.

The greater part of the locomotives made in the country, however, are built by 2 shops in Boston, 2 in Taunton, 3 in Paterson, and 2 in Philadelphia. One at Portland, Maine, one at Baltimore, and perhaps one or more in the State of New York, built a few locomotives, but were chiefly engaged in other work.

*Statistics of locomotive engines produced in the United States during the year ending June 1, 1860.*

STATES.	No. of establishments.	Capital invested.	Cost of raw material.	No of male hands employed.	Annual cost of labor.	Annual value of products.	No. of locomotive engines.

\* The number of engines in these States was estimated.

#### SEWING MACHINES.

These employed but few establishments in 1850; but their manufacture increased rapidly in the next ten years, and, in 1860, occupied 74 manufactories in 12 States, a capital of \$1,426 and 2,287 hands. They turned out 111,263 machines, of the value of \$4,247,820.

Sewing machines were made in all the New England States except Maine, the factories in that section numbering 22, from which were turned out 61,746 machines, worth \$2,506,300. Of that value \$1,104,800 was the product of 10 factories in Massachusetts, which made 21,700 machines. Five factories in Connecticut reported 24,046 machines made, and valued at \$1,043,805, and 11 in Pennsylvania made 12,800 machines, worth \$406,480. Ohio turned out 11,423 sewing machines, worth \$262,935. In most of the other States the product was small. Sewing machines are now exported to several foreign countries. The value exported in 1861 was \$61,000.

## INTRODUCTION.

## FIRE-ARMS.

Fire-arms were manufactured, in 1860, in 239 establishments, having a total capital of \$2,512,781 and 2,056 hands. They reported a value of \$2,342,681 made, of which sum \$1,544,090 was the product of 26 factories in New England, \$625,094 the value made in the middle States by 94 establishments, \$85,834 by 72 in the western, \$72,652 by 41 shops in the southern, and \$15,011 the product of 6 factories in the Pacific States. The largest amount was made in Connecticut, where 9 manufactories, chiefly at Hartford, New Haven, and Norwich, including some of the largest private armories in the United States, produced upward of one-half the total value made in the country, or \$1,186,500. Seven factories in Massachusetts turned out fire-arms of the value of \$340,000, including the product of the United States army at Springfield, the product of which, like that of several private establishments, was increased many fold during the late rebellion. In Pennsylvania 44 establishments reported a value of \$336,030, and 37 in New York \$193,739; 1 in New Jersey produced \$60,000 worth, and 6 in Maryland \$56,400. Twenty fire-arms factories in Ohio reported a value of \$26,420. In all the others the value made was below \$20,000 each.

## HARDWARE.

The number of establishments for the manufacture of general hardware in 1850 was 340, reported from 16 States of the Union. They employed altogether a capital of \$3,539,025 and 7,030 persons. The value of hardware manufactured was \$6,957,770, of which 96 factories in Connecticut produced \$2,360,190, and 112 in New York a value of \$1,807,140; the value in each of the others being less than a million, and in all but 4, less than one hundred thousand dollars.

In 1860 the total number of hardware establishments in 19 States was 443. Their aggregate capital amounted to \$6,707,000; the cost of materials was \$4,402,758; the number of hands, 10,721, of whom 1,263 were females; the cost of labor was \$3,443,664, and the value of the product \$10,903,106, an increase of 56.7 per cent. on the product of 1850.

Upwards of two-thirds the entire value of hardware made was the product of 204 establishments in New England, employing in the manufacture a total capital of \$4,649,100, and 5,587 male and 1,088

female hands. The value of the goods made in these States was \$7,281,603, which was nearly double the product of the same States in 1850, and \$323,853 more than the value made in all the States in that year.

Of that sum 118 establishments in Connecticut, having altogether invested \$2,887,800 and 4,706 hands, produced a value of \$4,812,043, or nearly 62 per cent. of the whole, and 103.8 per cent. in excess of the value made in the State in 1850. These manufactories are distributed throughout the State, and are particularly numerous in the valleys of the Naugatuck and Housatonic rivers, and the counties of Hartford, New Haven, and Middlesex. They employ machinery in the production of every description of useful and ornamental article of iron, brass, copper, and other metals, to an extent and perfection that has rendered the State pre-eminent for the excellence and variety of its miscellaneous and general hardware, which, for cheapness and ingenious adaptation to every requirement of household and general economy, is nowhere excelled. Twenty establishments in Hartford county produced miscellaneous hardware of the value of \$1,368,264, and six manufactories of coach and saddlery hardware in the same produced a value of \$174,460. Much of these values was made at New Britain, where one large establishment manufactured locks and other building and miscellaneous hardware of the value of \$500,000, employing 400 hands, and another, with 245 hands, a value of \$252,000. In New Haven county 13 manufactories of miscellaneous hardware produced a value of \$816,600, and 8 others manufactured coach and saddlery hardware worth \$323,100, much of which was the product of hardware establishments in Meriden and its vicinity. Twenty establishments in Middlesex county made miscellaneous hardware of the value of \$306,720. Four establishments in New London county, chiefly at Norwich and New London, produced the value of \$209,760 in miscellaneous hardware.

In Rhode Island 8 establishments manufactured hardware to the value of \$1,376,300, employing therein 868 persons, and a capital of \$1,183,400. Sixty-six smaller establishments in Massachusetts, with 854 hands, produced a value of \$855,000, and 7 in New Hampshire returned a value of \$147,950.

The hardware manufactories of the middle States numbered 209. Their investments amounted to \$1,967,450, the number of persons employed to 3,629, and the value of their manufactures to \$3,263,207, the increase being less than 10 per cent. Ninety establishments in New York, with the labor of 1,549 persons, manufactured hardware of the value of \$1,409,999, which was less than the value returned in 1850. Fifty-four factories in New Jersey, employing 1,291 hands, produced the value of \$1,071,783 in hardware, an increase of over 360 per cent. In Pennsylvania 54 establishments, with 766 hands, turned out hardware of the value of \$764,303, which was a decline from the product of that State in 1850; and in Maryland, where the number of factories was increased from 2 to 6, there was also a falling off in the value of the product.

Twenty-three factories in the western States, of which 17 were in Ohio, employed a capital of \$83,700 and 384 hands, making hardware to the amount of \$326,736, an increase of 74 per cent. The increase was principally in Ohio, in which 366 hands produced a value of \$309,316, an increase of 99 per cent. In Kentucky, which made no return in 1850, the value of \$3,100 was returned by one establishment. In Missouri the product fell off from \$21,350 to \$6,100; and Indiana, which returned a value of \$2,000 in 1850, made no return of hardware in 1860.

*Statistics of hardware of all kinds produced in the United States during the year ending June 1, 1860.*

# STEEL.

The number of steel furnaces in the United States in 1850 was 5, all in Pennsylvania. They employed a capital of \$52,300 and 40 hands, consumed materials of the value of \$133,420, and paid for labor \$23,100, yielding a product valued at \$172,080.

In 1860 returns were made of 13 steel-making establishments, of which 9 were in Pennsylvania, 2 in New York, and 2 in New Jersey. Their total capital amounted to \$1,640,000. The number of hands was 748, and the cost of labor \$308,736. The materials used cost \$805,174, and produced 11,838 tons of steel, valued at \$1,778,240, an average value of \$150 per ton. The product was nearly tenfold the amount manufactured in 1850.

The Pennsylvania furnaces employed a capital of \$1,345,000 and the labor of 592 persons. They manufactured 9,890 tons of steel, worth \$1,358,200, being about eightfold its product in 1850, and an average of \$135 per ton. Six of the establishments were in Alleghany county, and their united capitals amounted to \$1,230,000, and the number of hands in them to 522 persons. They used 3,600 tons of pig-iron, 3,500 tons of blooms, and 1,100 tons of bar-iron, and made 6,390 tons of steel, of which about 2,000 tons was cast-steel, besides carriage-springs and some axles, valued altogether at \$880,000. The largest of the six employed 220 men and produced steel, &c., of the value of \$400,000, and another employed 150 hands, with a product of \$300,000.

Three smaller establishments, in Philadelphia, owned capitals amounting to \$115,000, and with the labor of 70 hands manufactured steel of the value of \$458,000. Of these last, one made 800 tons of cast-steel, worth \$90,000; another 1,200 tons of German and 200 tons of cast-steel, together valued at \$174,200; and the third made 200 tons of saw-steel, 500 tons of spring-steel, 350 tons of plow-steel,

and 200 tons of shovel-steel, a total of 1,250 tons, valued altogether at \$194,000. In its production were used 1,400 tons of scrap-iron, 350 tons of Swedish, and 1,850 tons of other iron; total, 3,600 tons.

The 2 furnaces in the State of New York combined a capital of \$205,000 and employed 91 hands. From materials valued at \$137,899 they made 1,248 tons of steel, worth \$277,040, an average price of \$222 per ton. One of these, the Peru Iron Company, in Clinton county, used 50 tons of bar-iron, and made 48 tons of steel, worth \$5,040. The other, the Damascus Steel and Iron Company, on Staten Island, with a capital of \$200,000 and 90 hands, made 800 tons of rolled steel, worth \$160,000, and 400 tons of hammered steel, valued at \$112,000; total, 1,200 tons, worth \$272,000. The materials consumed in the production of this amount were 1,300 tons of bar-iron, costing \$84,000; 6,000 tons of coal, worth \$27,000; and other materials valued at \$23,000; a total of \$134,000.

The New Jersey steel furnaces had a total capital of \$90,000 and employed 65 hands. One was in Morris county, and used 800 tons of iron and the labor of 40 men, producing 400 tons of cast-steel, valued at \$88,000. The Etna Steel Works, in Jersey City, consumed 300 tons of iron, and with 25 hands made 300 tons of steel, worth \$75,000; a total of 700 tons, worth \$163,000; an average value of \$231 per ton.

#### MANUFACTURES OF STEEL.

The various manufactures consisting wholly or in part of steel, such as cutlery, axes, and other edge tools, artisans' tools of different kinds, saws, springs, steel wire, &c., employed 382 factories, with a total capital of \$5,797,649 and 7,284 persons, whose labor produced a value of \$9,151,893.

CUTLERY was made in 51 establishments to the value of \$1,366,223, of which \$1,104,750 was produced by 16 factories in New England—\$219,225 by 23 in the middle States. The largest product, or \$721,200, was by 6 factories in Massachusetts, of which the principal were at Shelburne Falls, where the largest factory in the United States is located, and at Chicopee and Boston. Nine factories in Connecticut, chiefly in New Haven county, at Meriden, and in Litchfield county, returned a value of \$381,750. Four factories in New Haven county made table, pocket, and other cutlery of the value of \$253,200, of which value \$167,000, was by 1 factory at Meriden. Seven cutlery factories in Newark, New Jersey, produced a value of \$161,000, and 9 in New York \$33,125. Six at Cincinnati, Ohio, reported a product of \$16,800.

AXES AND EDGE-TOOLS employed 166 establishments, with a product of \$3,243,992, of which New England produced \$1,582,659. Of the latter sum 18 shops in Connecticut returned \$730,035; 19 in Massachusetts, \$649,056; and 9 in New Hampshire, \$135,600. The largest product of edge-tools was in the State of New York, where it amounted to \$959,168, as the product of 45 factories. In Pennsylvania, 23 establishments made a value of \$372,925; and 17 in New Jersey, the value of \$257,925.

CARPENTERS' TOOLS, such as augers, auger-bits, gimlets, plane-irons, &c., employed 33 factories, and the product thereof was \$731,430. The largest number of factories was reported by Connecticut, in which 14 produced a value of \$264,400. The largest factory was at Humphreysville. Seven factories in New York turned out tools worth \$189,400; and 4 in Ohio, a value of \$163,880.

COOPERS' TOOLS were made to the amount of \$9,100 by 4 establishments in Ohio, employing 12 hands.

CURRIERS' TOOLS employed 2 regular factories in New Hampshire, together employing 5 men and producing the value of \$5,197.

SHOEMAKERS' TOOLS were made in 3 States, by 39 factories, to the value of \$93,592, of which \$77,000 was made by 3 in New York; \$8,592, by 3 in New Hampshire; and \$8,000, by 1 in Ohio.

STONE-CUTTERS' TOOLS, to the amount of \$850, were made by one shop in Ohio.

SAWS employed 42 establishments in 11 States. The number of hands engaged in the manufacture was 756, and the value of saws manufactured was \$1,237,063, of which 8 factories in New England, with 108 hands, made \$258,400. Of the latter sum \$205,000 was the product of 3 in Massachusetts, of which the largest were 2 in Boston; the oldest of them established in 1830, when the

## INTRODUCTION.

total value of saws manufactured in the United States was only about \$5,000 annually. Twelve factories in New York produced saws of the value of \$352,750, and 9 in Pennsylvania \$330,599. Among those in Pennsylvania, several in Philadelphia are among the oldest and largest in the country, one of them having been established in 1802. Eleven factories in the western States produced saws worth \$266,314, of which 6 in Ohio made a value of \$87,314.

SPRINGS FOR CARS, CARRIAGES, AND LOCOMOTIVES were manufactured in 40 establishments, to the value of \$2,117,377. Although made in 9 States, the principal values were produced in Connecticut, three of the middle States, and Virginia. Ten establishments in the first-named employed 497 persons, and turned out a value of \$952,550, chiefly carriage-springs, of which amount \$434,000 was returned by 2 in New Haven and vicinity, and \$218,500 was the value of springs and axles made at Bridgeport. Seven factories in New York reported a value of \$451,020, 5 in Pennsylvania \$134,082, and 7 in New Jersey \$224,200, as the value of car and carriage springs made. One manufactory of car-springs at Wilmington, Delaware, made a value of \$24,750, and one large one in Virginia, with a capital of half a million, a value of \$225,000.

STEEL WIRE employed 4 establishments, with 123 male and 18 female hands, who manufactured a value of \$101,600.

NAILS AND SPIKES were made in 1850, by 87 establishments, in 13 States, and employed a capital of \$4,428,498. The cost of raw materials was \$4,438,976, and of labor \$1,812,972, which was the wages of 5,231 persons, who turned out a product of \$7,662,144.

In 1860 the number of nail-works reported in 12 States and Territories was 99. Their capitals aggregated the sum of \$5,810,250, and the number of work people, including 157 females, was 6,878. The cost of wages was \$2,398,872, and of materials \$6,069,195, the value of nails and spikes made being \$9,857,223, an increase of 28.6 per cent.

# INTRODUCTION.

cxcv

The value made by 44 nail factories in New England, employing 2,440 persons, was \$3,689,321, of which \$3,326,321 was made in Massachusetts by 40 mills, employing 2,068 male and 135 female hands, and a capital of \$1,781,500; and \$327,000 by 3 establishments and 223 hands in Rhode Island. The balance was the product of one factory in Vermont. The nail-works of Massachusetts, which, in the last century, were numerous at Bridgewater, Abington, and other places where machinery for cut-nails was introduced as early as 1786, now produce more than one-third of all the nails and spikes made in the United States.

In the middle States these articles were manufactured to the value of \$4,408,432, by 38 establishments, employing 3,202 persons. More than one-half the value, or \$2,268,355, was the product of 20 nail factories in Pennsylvania, employing 1,628 males and 20 females. Of these 5 rolling mills and nail-works in Pittsburg, with 889 men and 20 women, produced a value of \$1,031,968, in addition to railroad spikes, &c., to the value of \$325,000, made by 2 manufactories, employing 110 hands and a number of Swett's railroad spike machines, or other mechanism, which produces 50 half-pound spikes per minute, and 5 tons per diem for each machine, worked by 7 hands. Cut-nail machinery is also extensively used in Pittsburg; and 1 factory in Philadelphia made cut-nails of the value of \$173,000 per annum.

Fifteen nail-works in the State of New York, with 649 hands, returned a value of \$1,021,736; 2 in New Jersey, with 546 hands, made nails and spikes worth \$968,341; and 1 in Maryland, employing 160 hands, made a value of \$150,000.

Seven nail and spike factories in Ohio returned a force of 370 hands, and a product of \$438,385. Of these 4 in Cincinnati made wrought-nails to the value of \$7,385, and one spike and railroad-chair factory produced a value of \$93,000.

Five mills in Virginia, with the labor of 1,026 persons, returned nails and spikes made of the value of \$1,222,000, making that State the fourth in the amount of these articles made.

Three small factories in Utah, with 20 hands, returned a value of \$35,712.

*Statistics of nails and spikes produced in the United States during the year ending June 1, 1860.*

# INTRODUCTION.

**BOLTS, NUTS, WASHERS, AND RIVETS** were made, in 1860, in 54 establishments, employing a capital of \$1,235,300 and 1,504 hands. The value made was \$2,175,555. The States of Connecticut and Pennsylvania were the largest producers, the former having 13 factories, producing a value of \$663,750, of which the counties of Hartford and Fairfield each returned \$250,000. In Pennsylvania 10 establishments reported a product of \$591,500, of which value \$410,000 was returned by 7 factories in Philadelphia. In Massachusetts a value of \$179,600 was made, and in Rhode Island \$186,300, each State having 4 factories. The Providence Tool Company's Works in the latter State employ a large number of cold punching presses, invented by A. O. Arnold, of Pennsylvania, and early adopted by them for punching nuts from cold iron. In New York the value of \$108,300 was made; in New Jersey, \$157,975; and in Missouri, \$162,000. In the other States the product was smaller. Many establishments employ machinery for making rivets also, by which rivets, weighing 7 to the pound, are made at the rate of 80 per minute.

**SCALES AND BALANCES**, in 1850, employed 22 manufactories in 11 States, with capitals amounting to \$130,267 and 402 hands, producing a value of \$359,505. In 12 States, in 1860, scales and balances were made, in 43 establishments, to the value of \$1,292,560, an increase of 260 per cent. They employed a capital of \$744,300 and 725 persons. Of the total product, 6 factories in New England returned a value of \$700,200; and \$665,000, or more than one-half the total value, was the product of 2 factories in Vermont; the factory of E. & T. Fairbanks, at St. Johnsbury, being the principal one in the United States. Since the first patent was taken out by Thaddeus Fairbanks, in 1831, upward of 100 different modifications of steelyards, scales, and balances have been manufactured by them, and in the same time they have manufactured about 150,000 scales, which are exported to foreign countries, and have proved a benefit to the commercial classes.

**BLACKSMITHING** was carried on in 1850 by 10,373 establishments in 32 States, to the value, annually, of \$16,048,536, employing 25,002 hands, including 19 females, and a capital of \$5,884,149.

In 1860 there were returned from 38 States and Territories only 7,504 blacksmithing establishments, having capitals amounting to \$4,940,756 and 15,720 hands, including 1 woman. The value of work executed was \$11,641,243, a decrease of 13.7 per cent., due, probably, in part, to the transfer of much of the heavier work to regular forges and to other manufactures employing machinery and other improved processes.

The several branches of the iron manufacture above enumerated, which do not include all manufactures of that metal and of steel, yielded altogether, in 1860, a product of \$205,879,510.\* Many of these, especially the manufactures of pig, bar, and rolled iron and steel, of heavy castings, marine engines, fire-arms, &c., were greatly increased during the war just ended.

In the year ending June 30, 1864, direct taxes were paid on iron and manufactures thereof to the amount of \$3,303,027, and on steel and its manufactures to the amount of \$391,141, a total of \$3,694,178. The quantities of the principal articles subject to tax and the amount of tax paid on each was approximately as follows, viz:

	Tax collected.		Tons
Railroad iron, paying 75 cents to \$1 50 per ton.....	\$295,064	=	276,192
Band, hoop, sheet, and plate iron, paying \$1 50 to \$2 per ton.....	242,513	=	153,921
Bar and other rolled iron, nails, spikes, &c., paying 50 cents to \$1 50 per ton.....	279,932	=	201,279
Castings, paying \$1 to \$1 50 per ton.....	242,736	=	172,985
Stoves and hollow-ware, \$1 50 per ton of 2,000 pounds.....	123,487	=	82,325
Wood-screws, paying 1½ cent per pound (41,962 pounds).....	62,943	=	21
Steel of all kinds, paying \$4 to \$10 per ton.....	91,768	=	10,862½
Marine engines, paying 3 per cent.....	65,434		
Manufactures of iron, paying 3 per cent.....	1,891,061		
Manufactures of steel, paying 3 per cent.....	299,373		

\* Exclusive of the use of Iron used in the Manufacture of Agricultural Implements.

**SALT MANUFACTURE.**

The number of salt-works in the United States in 1850 was 340. They returned an aggregate capital of \$2,640,885; a consumption of raw materials of the value of \$1,051,425; an expenditure for the labor of 2,699 male and 87 female hands of \$754,224; and a product of 9,763,840 bushels of salt, valued at \$2,222,745, an average of  $22\frac{1}{2}$  cents per bushel, and estimating a bushel to weigh 56 pounds, equivalent to  $23\frac{1}{2}$  pounds for each person in the Union.

The manufacture of salt employed on the 1st day of June, 1860, in 12 States of the Union, 399 establishments, whose aggregate investments in the business amounted to \$3,692,215, and the number of persons employed by them, including 23 females, was 2,213. The cost of raw materials used annually was \$1,054,780, and of labor employed \$371,954. They produced 12,717,200 bushels of salt, valued at \$2,289,504, an average value of 18 cents a bushel, and an increase of 30.2 per cent. on the product of 1850.

About 59 per cent. of the whole quantity, or 7,521,335 bushels, valued at \$1,289,511, was the product of the State of New York, from which returns were made of 296 salt-making establishments, having a total capital of \$2,313,590, and employing 1,079 persons, at an annual cost for labor of \$24,520, and for raw materials of \$676,301. The product was an increase of 3,021,335 bushels, or upward of 67 per cent. on that of 1850. The limited outlay for labor in proportion to the aggregate business done in that State is due to the fact that the New York salines are the property of the State, which pumps up the water and delivers it on the premises of the manufacturers for a royalty sufficient to cover the expense. The average value per bushel in that State was a little over 17 cents.

Next to New York the largest production of salt was in Virginia, (now West Virginia,) in which were 14 salt-works, having collectively a capital of \$523,800 and 445 hands, (of whom 11 were females,) whose annual wages cost \$148,464. The cost of materials consumed was \$166,004, and the quantity of salt made 2,076,513 bushels, valued at \$410,684, an average value of 19.2 cents a bushel. That State produced rather more than one-sixth of the whole quantity made, but fell off from its production in 1850 about 59.6 per cent.

In Ohio, 28 establishments, with a total capital of \$338,700 and 293 hands, manufactured 1,743,200 bushels, valued at \$276,871, or a little over  $15\frac{3}{4}$  cents per bushel. The cost of materials was \$139,627, and of labor \$91,524 per annum, and the increase in the quantity of salt made was 216.7 per cent. over the yield of 1850.

Pennsylvania ranked next to New York in the number of salt-works returned, which was 34, with capitals amounting altogether to \$190,800 and 205 hands, whose wages cost yearly \$64,776, the cost of materials being \$48,603, and the quantity of salt made 1,011,800 bushels, valued at \$196,916, an average of nearly  $19\frac{1}{2}$  cents a bushel. The increase of product was only 10 per cent.

Returns were made from 6 salt-works in Kentucky, having invested a capital of \$70,000 and employing 66 male and 8 female hands, at an annual cost of \$14,978. They produced 169,665 bushels of salt, worth \$41,190, an average value of about  $24\frac{1}{2}$  cents a bushel, and a decrease in quantity of 68.8 per cent. from the returns of 1850. In each of the remaining States the product fell below 50,000 bushels.

In Massachusetts 13 establishments were engaged in making salt, with 21 hands, by solar evaporation, to the amount of 31,525 bushels, valued at \$9,832, or upwards of 31 cents a bushel; and one in Illinois, with a capital of \$38,000 and 15 hands, produced 35,000 bushels, worth \$10,000, or  $28\frac{3}{4}$  cents per bushel. One establishment in Florida reported a capital of \$35,000 and 12 hands, which made 40,000 bushels, valued at \$11,000, an average of  $27\frac{1}{2}$  cents a bushel and an increase of \$5,000 upon the value returned in 1850. Two salt-works in Texas in 1850 returned a manufacture of 8,000 bushels of salt, worth \$5,900, and in 1860 29,800 bushels, valued at \$1 a bushel. Their capitals amounted to \$47,000, and the persons employed, including 4 females, to 22. The largest establishment in the

western States was one in Michigan, which had just commenced business, with a capital of \$100,000 and 30 hands, which had produced in the ten days it had been in operation, 2,362 bushels of salt, worth \$600, or nearly  $25\frac{1}{2}$  cents a bushel, with an expenditure for raw materials of \$275, and for labor of \$200.

Next to the five principal salt-producing States, first mentioned, the largest quantity of salt reported was by 2 establishments in California, which, with a capital of only \$800 and 15 hands, produced 44,000 bushels, valued at \$7,100, an average value of 16 cents a bushel. The cost of labor was \$5,400, that of materials used not returned. One concern in Utah, having invested \$4,000 in salt-making, paid for materials \$5,000, and for the labor of 2 hands \$840, producing 12,000 bushels of salt valued at \$6,000, or 50 cents a bushel. From Maine and Connecticut, each of which made returns of salt made in 1850, no report was received in 1860.

The average annual consumption of salt by each person in the United States has been estimated to be about 60 pounds; in Great Britain it is about 25 pounds, and in France  $21\frac{1}{2}$  pounds for each inhabitant.

If each bushel be supposed to weigh 56 pounds, the total production of salt in the United States in 1860 was 712,163,200 pounds, which was equivalent to rather more than  $22\frac{1}{2}$  pounds to each inhabitant of the Union in that year, or one pound more than the average annual consumption per capita in France,  $2\frac{1}{2}$  pounds less than in England. It was  $37\frac{1}{2}$  pounds less than the amount required for home consumption by each individual, the total deficiency being 1,174,326,060 pounds, or 33,687,308 bushels.

The only States which produced a surplus were New York and Virginia, in which the production of salt amounted, respectively, to  $168\frac{1}{2}$  and  $72\frac{3}{4}$  pounds *per capita* of the population of those States, and, in the first of them, to an average of upward of  $13\frac{1}{4}$  pounds for each person in the Union. In each of the other States the manufacture of salt fell below the average required for each one of its inhabitants; and in Ohio alone, where it was  $41\frac{3}{4}$  pounds to each person, exceeded the average production of the whole Union *per capita*. In Pennsylvania the product reached  $19\frac{1}{2}$  pounds, in Kentucky  $12\frac{3}{4}$  pounds, in California  $8\frac{1}{4}$  pounds, and in Massachusetts amounted to only  $1\frac{1}{2}$  pounds to each inhabitant of the State.

Although the census of 1860 showed only 12 States to have been engaged in the manufacture of salt, no less than 23 States have at different periods made returns of this industry, and deposits of salt, salt springs, or lakes, are found in nearly every State and Territory of the Union. It has been made by the evaporation of sea water on our Atlantic shores from the first settlement of the country; and since an early period, also, from the salt springs existing in various States, which are the principal source of the present production, those of New York, western Virginia, Pennsylvania, and Michigan being the most noted. Rock salt has been found in western Virginia, in Missouri, Utah, California, Arizona, and the Salmon mountains of Oregon, and salt lakes in Minnesota, Texas, New Mexico, Utah, and California. The great salt lake of Utah, situated toward the summit of the Rocky mountains, 4,200 feet above the level of the sea, has an area of 2,000 square miles, and furnishes one of the strongest and purest brines in the world.

With natural resources so abundant, cheap fuel, and a climate well adapted by its warmth and dryness for making salt, either by solar evaporation or by boiling, there is no reason why a future census shall not show that the United States is more nearly independent of foreign countries for an article that is indispensable as a condiment and antiseptic for the seasoning and preservation of food, and as a material in several processes in the arts, and which is probably consumed by our population to a greater relative amount than by any other people.

Salt was first made in this country near Cape Charles, in Virginia, previous to 1620, and having been allowed, with other interests of the colony, to go to decay, the works were again set up in that year on a scale designed not only to supply the colony itself but also the northern fisheries. Salt was exported thence to Massachusetts in 1633. For the encouragement of the salt-works of Colonel Scar-

borough at Accomac, on the eastern shore of the Chesapeake, the colonial assembly, in 1662, prohibited the importation of salt into the county of Northampton, but repealed the act four years later.

At a place long afterward known as the "Salt Ponds," on Sewee bay, or Bull's harbor, South Carolina, salt-making was attempted about the year 1689 by Sir Nathaniel Johnson, an enterprising emigrant from the Leeward Islands. What success he met with is unknown; but the manufacture of salt in that province was encouraged by acts of assembly in 1725.

The first salt-works in New England appear to have been erected, about the year 1623, by a company which settled near the present city of Portsmouth, in New Hampshire.

In 1624 the Plymouth Colony commenced the manufacture of salt, and in the following year attempted the same thing at Cape Ann, but were unsuccessful through lack of skill in the manager. In 1629 a more skilful person was sent out from England, and the right of making salt for sale was reserved to the company in London until the transfer of authority from London to the colony, when it was placed on the same footing with other industries. Salt-making was commenced at Salem in 1636, and in 1641 Samuel Winslow was allowed, for 10 years, the exclusive right of making salt in Massachusetts by a new method. Like privileges for 21 years and 30 acres of land were the same year granted to John Jenny and associates for making salt at Plymouth, and they were required to sell it at two shillings a bushel. These efforts were, however, inadequate to supply the colonists, who were actively engaged in the shore fisheries, and salt frequently became very scarce and dear. In March, 1648, John Winthrop, jr, was encouraged to manufacture salt, by a new method, under an act of the assembly making salt receivable for public taxes at the principal towns, the first year at the same rate as wheat, bushel for bushel; the second year two bushels for each family were to be taken at three shillings a bushel, and the third year 200 tons at two shillings per bushel. In the following year he received a grant of 3,000 acres of land, on condition that within three years he set up, between the capes of Massachusetts bay, works to make at least 100 tons of salt per annum. This effort appears to have been successful, and in 1656 the proprietor was granted, for 21 years, exclusive privileges for making salt "after his new way." In 1652 salt-works were ordered to be set up at Cape Ann; and about the same time, Edward Burt, who was refused the use of two islands near Salem for salt-making, because it was "prejudicial to the town in divers ways," received leave to carry on the business for 10 years at Cape Ann, provided he made it only after his own "new way;" but, in 1673, it was officially reported that no salt was made by the solar process in New England. In 1746 two persons, named Jerome, proposed to set up evaporating pans to make salt in Connecticut.

Previous to the Revolution the manufacture of salt along the Atlantic shores, from Cape Cod to Georgia, was a very rude process. It was made in New England chiefly by boiling, the water being pumped from the sea, either by hand-power or by the aid of wind-mills. About 250 gallons of water were evaporated to obtain a bushel of salt, which crystallized in fine grains, and was often quite impure. About the year 1775, the first considerable attempt to make salt along our eastern shores, by solar evaporation, was commenced by the salt-boilers of Harwich, on Cape Cod, and more successfully, two years after, by John Sears and others, at Dennis, in Barnstable county, where they built a vat 150 feet in length and 10 in width, and covered it with a curiously constructed roof. Salt having soon after risen in price to six and eight dollars a bushel, many other solar salt-works were constructed on the plan of Mr. Sears, who, in 1799, obtained a patent for a machine for manufacturing salt. In the following year Hattel Tilley, of Massachusetts, took out a patent for a method of covering vats by causing a double roof to revolve on an upright post. He was enabled to make pure white salt weighing 70 to 75 pounds to the bushel, and to make the process more economical by extracting from the mother-waters the crystallized sulphates of soda and magnesia. In 1802 it was estimated that \$130,000 was invested in the manufacture of salt in Barnstable county, Massachusetts, which yielded a profit of 25 per cent. The number of salt-works was then 136, having an evaporating surface of 121,313 feet and a capacity to make 40,438 bushels of pure white salt, and 181,969 bushels of glauber salt, worth together \$40,700. The works were increased the next year, by adding 27,587 feet of surface.

Captain John Sears, who had triumphed over many difficulties, was the only successful manufacturer of salt by solar evaporation, for which his works at Dennis were quite extensive. These appear to have been conducted essentially upon the plan since found most efficient, and used along our sea-coast and in Florida and at Onondaga for making salt by solar heat, in which the advantage is taken of the different degrees of solubility or affinity for water in the several salts which are constituents of the brine. By conducting the evaporation in a series of vats or shallow tanks those salts which are least soluble are first deposited, and afterward successively those that have greater affinity for water, until the chloride of sodium is crystallized nearly pure. At Martha's Vineyard, Nantucket, Plymouth, Kingston, Rochester, Hingham, and Dorchester other works of this kind were commenced within two or three years, those at Dorchester the same year, by Captain Deane, who had, at Preston's Point, a series of vats 200 feet long with 4,000 feet of evaporating surface. In 1810 Massachusetts contained 468,198 square feet of roofing for salt-works, and manufactured 118,757 bushels of salt, valued at \$79,526. The salt-works in that State were exempted from taxation, and in 1809 the manufacturers petitioned Congress for a restoration of the duty on foreign salt.

This duty, which had been laid, in 1789, at 6 cents a bushel, and raised the next session to 12 cents, was increased in 1797 to 20 cents a bushel, but in 1807 was entirely repealed. In July, 1813, the duty of 20 cents was again imposed during the war, and was continued until 1832, when it was reduced to 10 cents a bushel, and in 1842 to 8 cents.

The manufacture now increased, and in 1820 was stated to employ, in Massachusetts, a capital of \$777,000, and to yield an annual product of \$95,000. A memorial to Congress, in 1827, against the repeal of the duty, stated that the salt-works of that State were numerous, and made annually (chiefly by solar evaporation) 600,000 bushels of the best salt, Barnstable county alone having 15,000,000 feet of salt-vats, valued at \$1,300,000 and owned by 1,000 persons. The price of salt, which had been as high as 60 cents a bushel, had fallen to 33 cents at the works. In 1831 the area of salt-vats in the State was 17,545,700 square feet. Large quantities of solar salt were made at that time in Maine. On the reduction of the duty at this time the manufacture began to decline. In 1840 the product was 376,596 bushels, and in 1855, 319,630, valued at \$187,324, chiefly in Suffolk and Barnstable counties.

A refinery of imported rock-salt in Maine, in 1833, was said to have made in the previous year \$100,000 by making and selling refined salt at 25 cents a bushel, while common Liverpool salt, imported under a duty of 10 cents, cost 35 cents a bushel.

In 1631 a company of French emigrants arrived in an English ship to carry on salt-making at Piscataway, probably in New Jersey, along the southern shores of which, as well as of more southern provinces, there were many small salt-works before and during the Revolution, several of which were destroyed by the British, requiring means for their protection, and active measures by Congress and the several legislatures for their re-establishment. Salt-making was carried on at a later period in Cape May county, and, in 1818, large solar salt-works were erected at Lewistown, Delaware.

Salt-works were erected in New Netherlands by the Dutch previous to 1649. Imported white salt appears to have sold in that province before that as low as \$1 04 per half barrel; but in 1661 was very scarce. It rose to 12 guilders (\$4 80) per bushel. In that year Dirck DeWolff, a merchant of Amsterdam, received a grant of Coney Island, in New York harbor, for the manufacture of salt, for which he was also granted the exclusive right for seven years. In the exercise of this right he was resisted by the Connecticut settlers at Gravesend, on Long Island, where, in early times, salt was also made by exposing sea water in shallow vats along the shores to solar evaporation.

The saline springs of Onondaga had already attracted the notice of the French missionaries among the Indian tribes, by whom they were used, to a limited extent, as a source of salt. They were first mentioned by Pere Lallamont; and, in 1654, Le Moyne recorded a notice of them in his journal. He carried a sample of the salt to Canada, and, in 1658, communicated the discovery to persons in New Amsterdam, (New York.) Onondaga salt continued in common use among the Six Nations for more than a century, and, in 1770, was sold in Quebec. It was not until 1787 that salt was first made from

the springs near Syracuse, by boiling, at the rate of about ten bushels per diem. The lands were that year ceded to New York by the Oneida Indians, and the fountains were reserved to the State. In 1791 the capacity of the works there erected was 8,000 bushels per annum, and the product sold 60 miles westward for 50 cents a bushel. In June, 1797, these salines were first made the subject of legislative enactment. They were placed under a commissioner, and lots were leased to manufacturers, who were required to pay to the State a duty of 4 cents a bushel of 56 pounds, and to supply salt at not over 60 cents a bushel. The product of the springs in that year was 25,474, and the whole quantity from that time to June, 1861, inclusive, was 137,937,548 bushels.

In 1829, when the Onondaga salt-works produced 1,129,280 bushels, the manufacturers paid to the State, for the canal fund, a duty of  $12\frac{1}{2}$  cents a bushel of the standard weight of 56 pounds, and the salt was delivered, at a fair profit, in New York at 40 cents a bushel, after paying 9 cents freight and toll to Albany, 4 cents freight thence to New York, and 2 cents allowed for waste. The medium price of salt was then 48 to 50 cents a bushel. In 1834 the quantity made was 2,209,867 bushels, and the State duty was reduced to 6 cents a bushel, and the proceeds were transferred from the canal to the general fund of the State.

In 1846, when this duty yielded a large revenue to the State on a product of 3,838,851 bushels, the tax was reduced to its present rate of one cent a bushel, sufficient to cover the expense of sinking wells pumping, superintendence, &c.

The situation of the New York salines on the Oswego and Erie canals, with other outlets by the great lakes and by railroad, with access to large quantities of wood on the borders of the small lakes, and to the bituminous coal-fields of Blossburg, Pennsylvania, give the manufacturers unusual facilities for the manufacture of salt. The brine issues from rocks of the lower silurian series, and is obtained by boring wells from 50 to 312 feet deep, whence it is raised by steam-power and conducted to the boilers by troughs. A bushel of salt is made from every 40 or 45 gallons of water. It was at first made by boiling, but at present about one-eighth of the whole product is made by solar evaporation, and seven-eighths by boiling. The salt reservation is divided into four districts, those of Syracuse, Salina, Liverpool, and Geddes, of which, in 1863, the first produced, of solar and fine salt, 1,264,000 bushels; the second, 4,237,888; the third, 966,648; and the fourth, 1,473,847—total, 7,942,383. The great reservoirs for making solar salt cover altogether about 700 acres, and are divided into tanks 16 by 18 feet each and 6 inches deep, provided with movable covers, and producing each about 50 bushels annually of coarse salt, such as is used in packing and curing provisions, and weighing about 70 pounds to the bushel. The number of covers in use in 1863 was about 44,000, capable of making 2,200,000 bushels, and nearly 100 salt-blocks were unused for want of brine.

The manufacture of boiled salt is conducted in large cast-iron kettles, holding about 100 gallons each, set in "blocks" of brick-work, usually in two parallel rows. A double block may contain 80 kettles, each capable of making yearly 20,000 to 25,000 bushels of 56 pounds, with a consumption of one cord of hard wood, or a ton of coal, for every 45 bushels. In 1862 there were 316 salt blocks in the reservation, containing about 16,500 kettles, capable of making at least 12 million bushels of fine salt annually. But the State was at no time able to supply more than 190 blocks with brine, and the average number supplied was about 160. The cost of manufacturing coarse or solar, and common or fine salt does not materially differ, and is about one dollar a barrel of 280 pounds, or five bushels. New York salt has the reputation of being comparatively pure and uniform in quality, and the finest ground solar salt made at Onondaga is not surpassed by any. "Factory-filled" dairy salt, for table and dairy use, has been made by a modification of the English method, which produces the celebrated "Ashton's" brands, and sold, in 1862, in any part of the State for 31 to 37 cents a bushel. The business is carried on for about eight months in the year. The toll on domestic salt charged by the State canals is 1 mill per 1,000 pounds per mile, and the freight from Onondaga to Buffalo, 198 miles on the canals, amounts to 15 cents per barrel over the toll.

During the last century the western settlements were chiefly supplied with salt by the expensive and tedious system of "packing" on horses across the mountains from the maritime towns, which in turn derived their principal supplies through a prosperous trade with the West Indies and Europe, whence much salt was brought in ballast by returning timber and provision ships. The price of salt on the frontiers was always high in consequence. About the close of the century Onondaga salt first became an article of trade at Pittsburg, chiefly through the enterprise of General James O'Hara, an enterprising citizen who had a contract to supply the garrison at Oswego, New York, with provisions, and who carried back, by land and water carriage, domestic salt which he was able to deliver at Pittsburg at \$4 per bushel, or one-half its cost when packed over the mountains. In a few years a large trade grew up in this article, and the price fell to \$12 per barrel of five bushels, until the war, in 1812, suspended the supply.

In the mean time the numerous "salt-licks" in Pennsylvania and Virginia had attracted attention and some effort to produce salt. A company of Philadelphia and Pittsburg merchants are said to have erected salt-works on the Big Beaver creek, in 1784. In 1810 1 salt-work in Indiana county was reported as having made 600 bushels of salt, worth \$1,000. About that time, William Johnson commenced boring on the Conemaugh river, near the mouth of the Loyalhanna, and struck an abundant fountain of salt water at the depth of 450 feet, and erected furnaces, pans, &c., by which he made about 30 bushels per diem, which sold at a high price. Other wells were soon sunk at a depth of 300 to 600 feet in the coal-measures of that region, and the price of salt was reduced as low as \$1 per barrel, but afterward fixed at \$2, which afforded a profit. The pumps were first worked by horse-power, and afterward by small engines. In 1820 the business employed a capital of \$33,000 in western Pennsylvania, and in 1826 there were 35 salt-works on the Conemaugh and Kiskeminetas, 3 upon the Alleghany, and others in progress elsewhere, one of which was expected to yield 1,500 bushels daily. Salt was supplied at the works for 20 to 25 cents a bushel, while it brought 50 cents in Kentucky, Ohio, and Illinois. In 1840 Pennsylvania produced 549,478 bushels of salt, and in 1850 919,100 bushels, worth \$206,796.

The salt regions of Virginia, which are the most important after that of New York, are two in number, one along the Great Kanawha river, and the other in the southwestern part of the State, on the north branch of the Holston river, in Washington and Wythe counties. The manufacture was commenced at Kanawha in 1804. In 1810 that State produced 740,000 bushels, valued at \$704,000, of which 540,000 bushels, worth \$504,000, was made in Kanawha county, and the remainder in Westmoreland. Virginia salt was already coming in competition with that of New York. In 1820 23 salt-works in the Kanawha, having a capital of \$696,000 and 1820 kettles, &c., made salt at 75 cents a bushel. Kentucky, which in 1810 produced 324,870 bushels, worth one dollar a bushel, had, at that date, upward of 1,600 kettles, and make salt to the value of \$190,000 per annum. In 1831 about 2,400,000 bushels was the annual product of salt on the western waters, and the price was from 50 to 62 cents a bushel. Salt had seldom fallen below \$3 until the Kanawha works displaced the foreign. In 1840 Virginia ranked next to New York in this branch of production, having in that year made 1,745,618 bushels, which was more than one-fourth the product of the whole United States. In 1850 it produced 3,479,890 bushels, valued at \$700,466.

From North Carolina, in 1810, returns were made of 366 vats owned by 2 salt-works, which made 7,500 bushels, worth \$3,800.

The reservoirs of salt-water which underlie the valley of the Ohio and its branches were penetrated at several other points before the close of the last century. Salt was first made in the Muskingum valley in 1796, by a company. In a few years the springs passed into other hands, and finally to the State, which leased them at a fixed rate. In 1810 a manufacture of 24,000 bushels of salt, worth as many dollars, was reported from Ohio, and in 1830 the product of that State had increased to 446,350 bushels, valued at 37 to 50 cents per bushel, each bushel requiring 95 gallons of water to be evaporated. In 1850 that State manufactured 550,350 bushels, valued at \$132,293.

Salt was made to a limited amount in the last century in Tennessee, Illinois, Missouri, Louisiana, and other parts of the west. The Wabash salines, 26 miles below the mouth of the Wabash, which had been used for half a century by the French and Indians as a source of salt, made, in 1809, about 130,000 bushels. They were soon after leased by government, under the name of the United States salines, to Wilkins & Morrison, of Lexington, Kentucky, and, in 1817, yielded about 300,000 bushels annually, supplying the settlements in Illinois and Indiana at 50 to 75 cents a bushel. Near Shawneetown, in Gallatin county, Illinois, quite a trade in salt existed in 1817, and in Jackson and Vermillion counties salt was made some forty years ago from springs leased by the State.

In Missouri, where salt springs or flats abound, a son of Daniel Boone made the first settlement in Howard county, at Boone's Lick, or Mackay's salines, in 1805, for the purpose of carrying on the manufacture of salt, which is still made there. In 1811 Mr. Braxton Cooper superintended salt-works at Mine river, on the Upper Missouri, and rock salt was found near the head of the Arkansas before that time. In 1840 Illinois made 20,000 and Missouri 13,150 bushels. Between the Ouachita and Red rivers, in Arkansas, numerous salt-flats were early noticed, and salt-works were in operation previous to 1818 on the Saline and Red rivers. Salt was also made at Attacapas and some other places. A manufacture of 10,200 bushels, worth \$6,110, was reported from Orleans Territory in 1810, chiefly made at Natchitoches and Opelousas.

One of the most promising salt regions of the United States is that of Saginaw, Michigan. About the year 1842 a salt fountain was struck, by boring, at Grand Rapids, about forty miles from Lake Michigan, on the Grand river. The water yielded a bushel of salt from every 70 or 80 gallons evaporated. Messrs. Lucius Lyon & Co. commenced the manufacture of salt at that place, but it has not been found profitable, owing, in part, to the weakness of the brine. In 1859 the East Saginaw Salt Manufacturing Company was formed, with a capital of \$100,000, for the manufacture of salt at East Saginaw, where they commenced the following year. The progress since made in the salt manufacture at that place has not been equalled in any salt region of the United States in the same time. In 1864 the number of companies in operation was 67, and their total investments in the business amounted to \$2,269,500. They employed 892 men, and had in use 118 blocks, containing 4,210 kettles and 4,949 solar covers, and occupied 9,475½ acres of land. The quantity of salt made in the year was 529,078 barrels, or 2,645,390 bushels, valued at the shipping point at \$1,190,410. The southern coasts of Texas and the Florida keys are admirably adapted to making salt by solar evaporation, and the latter have, for the last 25 years, been a source of some domestic salt, made by a method similar to that pursued at New Bedford and Cape Cod. The quantity reported in 1840 was 12,000 bushels, and in 1850 the value made there was \$6,000, since which it has increased.

The comparative statistics of this manufacture during the last fifty years are as follows: Number of salt-works in the United States, as officially reported in 1810, 62; bushels of salt made, 1,238,365; value of same, \$1,149,725. In 1820 the value of salt made was about \$1,852,253. In 1830 the capital employed was \$6,964,988, and the product was 4,444,929 bushels, valued at \$935,173. In 1840 the capital remained about the same, and the quantity of salt made was 6,179,174 bushels, valued at \$1,235,835, or about 20 cents a bushel. In 1850 9,763,849 bushels, valued at \$2,222,745, were returned.

The importations of foreign salt amounted, in 1790, to 2,337,920 bushels; in 1820 to 4,010,569 bushels; in 1830 to 5,374,046 bushels; in 1840 to 8,183,203 bushels; in 1850 to 11,224,185 bushels; and in 1860 to 14,094,227 bushels, of which last amount upward of 10¼ million bushels were from Great Britain and its West India Islands. In the last of these years we exported of domestic salt 475,445 bushels, the greater part of it to Canada, which is the principal market for New York salt.

## INTRODUCTION.

*Statistics of salt produced in the United States during the year ending June 1, 1860.*

STATES.	Number of establishments.	Capital invested.	Cost of raw material.	NUMBER OF HANDS EMPLOYED.		Cost of labor.	Annual value of product.	Bushels of salt.	Per cent.
				Male.	Female.				
Massachusetts .....	13	\$30,525	\$1,020	91	.....	\$5,898	\$9,838	31,535	.....
New York .....	296	2,313,590	676,301	1,079	.....	24,520	1,289,511	7,521,335	67.1

\* This establishment having been in operation but ten days, the cost of labor was calculated for that time.

## AGRICULTURAL IMPLEMENTS.

[Extract from the introduction of Agricultural volume, census of 1860, pages XI to XXIX.]

"PROBABLY no exhibition of our national statistics is more important or satisfactory than the foregoing tables, showing the great increase and present extent of the construction and employment of agricultural implements and machinery.

"The high price of labor has stimulated mechanical invention. In no other country are there so many cheap and efficient implements and machines for facilitating the labors of the farm. In older and richer countries we find more expensive machinery, but, as a general rule, it is too complicated and cumbersome for our use. We have been thrown on our own resources, and have no reason to regret it.

"Whatever augments the productive capacities of the soil, or increases the profits of labor and capital employed on so large a scale, either in the first production or the subsequent handling of crops, becomes a practical element in the general prosperity. The vast power resident in machinery, even the more simple applications of the mechanical powers, with their modern perfection of detail, gives this creative force, which may be increased almost beyond computation by the use of steam as a prime mover. Thus, every machine or tool which enables one farm-hand to do the work of two, cheapens the product of his labor to every consumer, and relieves one in every two of the population from the duty of providing subsistence, enabling him to engage in other pursuits, either laborious, literary, professional, or scientific, practically duplicating at the same time the active capital or the purchasing power of the producer, thus enhancing the comfort of all, and stimulating the common enterprise.

"When the utility of labor-saving appliances in agriculture shall come to be fully apprehended, and made generally available in the clearing, draining, and tilling of the soil; in the planting, irrigating, cultivating, and harvesting of crops, and in their speedy preparation for market, we may regard the occurrence of famine, either from deficiency of labor, as in time of war, or from the contingencies of soil and climate, as practically impossible. Already has the use of improved implements, aided by scientific and practical knowledge in all the processes of the farm, resulted—like the use of machinery in other departments of industry—in such a diversification and increase of the forms of labor, and such a cheapening of its products under ordinary circumstances, that we rarely hear of the unreasoning and jealous violence of farm laborers, who in England, a generation since, wantonly destroyed all the agricultural machinery of a neighborhood, even to the common drills, in the mistaken opinion that its use was an infringement of their rights to labor. Its palpable advantages have disarmed the traditional prejudice of the husbandman himself, who is fast becoming as progressive as his neighbor. It has lifted much of the drudgery from the shoulders of the country-bred youth, who no longer loses his elastic step and suppleness of limb in the moil of the farm, which he once instinctively shunned as degrading, while he sought the lighter and more or less intellectual pursuits of the city. It has thus tended to elevate the pursuit of agriculture to its proper position in the social scale, as one of dignity and independence, and not one of mere physical toil, to be shared in common with the brute.

"It is in the United States especially, where vast areas of improvable and fertile lands invite the labor of a sparse population, that agricultural machinery is capable of effecting its greatest triumphs. Far back in our colonial days the stream of emigration bore the young and adventurous of the Atlantic settlements towards the richer bottoms and prairies of the west. A gradual deterioration of the fertility of the soil of older States from constant cropping, and the consequent increased labor required with the imperfect implements formerly in use, were sufficient to maintain the yearly exodus. Columns of hardy laborers from Europe have annually sought our shores, and for the most part have as promptly filed off in the same direction in quest of cheap farms, or in the more alluring search for the precious metals. As a consequence, civilization smiles upon the shores of either ocean, and looks down from the mountain summits which separate them. A prosperous and expanding agriculture, with most of the arts which it demands and fosters, has been rapidly extended over a territory of enormous breadth and fertility, which lacks only the labor of adequate cultivation to develop its vast resources in a wealth of cereal production as yet scarcely imagined. The very causes, however, which have opened up this territory to agriculture and the arts have produced and maintained a continued scarcity of labor, and kept its wages at a permanently high price. It is this enormous area of farm lands, and this great dearth of manual labor throughout the Union, that our inventors and mechanics have, from an early period, been invited to supply with labor-saving contrivances.

"Fortunately the people of this country have not been slow to adopt the most efficient substitutes for animal power, and the inventive talent of the nation has found an ample and remunerating field for its exercise in originating and perfecting instruments adapted to all the wants of the farmer and planter. The great staple products of cotton, grain, and hay, have especially demanded the substitution of mechanical for muscular labor, and some of the happiest products of American skill have been the result.

"Scarcely less valuable in the aggregate, however, are the numerous minor inventions whereby the labors of the farm and the household have been saved. Implements of this kind make up a large portion of the stock in trade of the makers and venders of agricultural wares. This successful application of the mechanics of agriculture has happily supplemented the rapid displacement of a large amount of rural labor called off by the war, manufactures, and the mines, and has itself in turn been stimulated by the high prices of produce consequent upon increased demand both for home and foreign consumption.

"Evidence that this scarcity of labor in the United States has been a principal incitement to the invention and manufacture of agricultural implements is found in a late report of the Commissioner of Patents, who states that 'the most striking fact connected with this class is the rapid increase of applications filed. Notwithstanding half a million of our agriculturists have been called from the farm to engage in military service, still the number of applications for patents on agricultural implements, (exclusive of reapers, bee-hives, horse hay-forks, and horse hay-rakes,) has increased from three hundred and fifty in 1861, to five hundred and two in 1863.\* The number of patented inventions belonging to the class of agriculture, previous to 1848, was 2,043, since which time the number has been vastly augmented. In the United States, as in Europe, the principal improvements in agricultural and horticultural implements have been made within the present century. As a branch of manufacture, this class of machinery has been wonderfully extended within the last ten or fifteen years, having received a great impetus from the exhibition in London in 1851—where our own progress in this respect created so much surprise among foreigners—and the several international fairs which have taken place since that time. Throughout Europe and America, until a comparatively recent date, the implements of the farm remained extremely rude, primitive, and inefficient in form. Attention appears to have been first strongly awakened to the value of mechanical aids in farming about the period of the first introduction of agricultural societies.

"The Royal Society, established in England in 1660, encouraged improvements in agriculture. But in the transactions of the Society for the Encouragement of Arts, Manufactures, and Commerce, instituted in London in 1753, we trace a still more liberal promotion, and a general interest in agricultural progress. These societies prepared the way for the establishment of purely agricultural associations. The first associated effort made in England to encourage agriculture by specific rewards was in the premiums annually offered by the Society of Arts after the year 1758, for experiments in husbandry, and for improved implements of the farm. The first agricultural society in Great Britain, the Society of Improvers in Scotland, established in 1723, encouraged improvements in tillage, and in farm implements, with such effect that 'more corn was grown yearly where corn never grew before than a sixth of all that the kingdom used to produce at any previous time.† About the same time Jethro Tull introduced—along with his system of deep tillage and thorough pulverization of the soil—the use of the horse-hoe, the drill, and other improved utensils, and became the greatest practical improver of agriculture in the last century. He even attempted an automatic threshing machine, and incurred the usual charge of being a visionary innovator. The profit of drill husbandry was also demonstrated by John Wynn Baker, of Kildare, in Ireland, who, in 1766, commenced a series of experiments with a view of systematizing agricultural knowledge by establishing fixed principles of rural economy, and showed by actual experiment that the saving effected by the drill and horse-hoe amounted in fifteen years to the fee-simple of all the tillage lands of the kingdom. He established as a part of his project a manufactory of farm implements, and issued a catalogue of seventy different machines and tools, all new to the agriculturists at that time. Agricultural machines were thenceforth made with more regard to scientific principles.

"The earliest agricultural associations in the United States were established in 1785, in South Carolina and Pennsylvania. In the first-mentioned State, indeed, nearly a century before, the assembly passed 'an act for the better encouragement of the making of engines for the propagating the staples of the colony,' which was followed by legislative encouragement to various individuals who improved the machines for pounding and cleaning rice. In 1784 the assembly enacted a regular patent and

\* Introductory report of Commissioner of Patents for 1863, page 21.

† Philips' History of Progress in Great Britain.

copyright law, giving to the authors of books and the inventors of useful machinery the exclusive benefit of their productions for fourteen years. The Philadelphia Society for Promoting Agriculture, established in March, 1785, and after a period of inaction revived and incorporated in 1809, through the exertions of the Hon. Richard Peters, awakened much attention to the subject of improved implements and machinery, by means of a judicious system of premiums, and of practical essays. In July, 1809, Mr. Peters proposed to the society 'a plan for establishing a manufactory of agricultural instruments, and a warehouse and repository for receiving and vending them.' In that paper he states that no manufactory of agricultural implements in general existed in the United States, although the demand was prodigiously great. The proposed manufactory was to produce, under the patronage of the society, every implement of husbandry, both common and extraordinary, in use at home or abroad, if approved on trial; none to be sold without inspection and the stamp of the society's agent. His plan also embraced a collection of models in the manner of the Conservatory of Arts and Trades, established at Paris a few years before. The Massachusetts Society for Promoting Agriculture, incorporated in 1792, labored successfully to promote like improvements. The first statistics of the national industry collected in the following year embraced one small manufactory of hand-rakes, in Berkshire county, Massachusetts, which made annually 1,100 rakes, valued at \$1,870. The census of 1820 gave very meagre information respecting this branch of production. Several small manufactories of ploughs, scythes, axes, shovels, hoes, &c., existed in different States, and one of patent steel pitchforks, in New Haven, Connecticut, turned out about \$5,000 worth annually. During the next thirty years the business increased more rapidly, the traditional prejudices of farmers gradually giving way before the established utility of labor-saving appliances in the cultivation of the vast domain of our national agriculture. The form and finish of ordinary farm tools were much improved, and a few grand inventions were brought forward. In 1833 rice was successfully threshed out in the southern States by animal and steam power. The harvesting of grain by machinery, which had been several times essayed at an earlier period, was the same year attempted at Cincinnati, where the late Obed Hussey cradled wheat as fast as eight persons could bind it.

"State and county agricultural societies were, during the same time, organized in nearly every section of the Union where they did not already exist. The system of annual fairs and exhibitions of farm products and machinery instituted by them, and encouraged by public awards of premiums, powerfully stimulated invention, and made our farmers familiar with the best forms of agricultural implements in use at home or abroad. Of like influence, but wider scope, was the American Institute in New York, which has made its influence felt in every department of industry.

"The exhibition of the industry of all nations held in London in the year 1851 exerted a vast influence upon the progress of ideas on the subject of mechanical agriculture, as it did upon all other branches of art. The contrast there presented between the highest results of modern skill and ingenuity exercised upon the implements of husbandry, and the rude models of the plough and other tools to be seen in the Indian department, little improved since the days of the Hebrew prophets, forcibly illustrated the agency of the mechanic and the engineer in the art of subduing nature to the will and service of mankind.

"Although the number of implements of each kind exhibited by the United States on that occasion was small, the variety shown was considerable. The general excellence of American ploughs, reapers, churns, scythes, axes, forks, and other implements, was acknowledged by the public admission of disinterested judges from all parts of the world, and the particular merits of many by the medals awarded, and by the number of orders received at the time by the manufacturers. The triumph of the American reapers marked a new era in agriculture, and gave a strong impulse to the inventive genius of Europe and America. The emulation awakened among manufacturers by the London exhibition was still further stimulated by the Crystal Palace exhibition, which took place in New York in 1853-'54, when more than one hundred American manufacturers competed for honorable distinction in this department of mechanics.

"The influence of these exhibitions of the collective ingenuity of the world upon our own countrymen, in furnishing our mechanics with a standard of comparison by which to measure their own contributions to the world's progress with the most improved implements of the civilized world, and our agriculturists—already familiar with American instruments through our State and local fairs—with a view of the appliances of agriculture in other lands, can scarcely be overrated.

"Some of the results are to be seen in the tables before us.

"Credit is also due to the United States Agricultural Society for instituting a great national field trial of reapers, mowers, and other implements, held at Syracuse, New York, in 1857, for the purpose of testing practically the relative merits of different machines and rewarding special excellence.

"The magnitude of the interests involved in the successful production of a new labor-saving implement for husbandry should alone prove a sufficient spur to inventors and manufacturers. A slight improvement in straw-cutters has enabled its inventor in a western tour of eight months with a model to realize forty thousand dollars. Another has been known to sell a machine to thresh and clean grain, after fifteen months use, for sixty thousand dollars. The McCormick reaper is believed to have yielded its inventor annually a princely income. A single manufacturer has paid the legal representatives of a patentee \$117,000 in a single year for the use of a patent-right on an agricultural machine which others were making at the same time by contract with the owner.

"From an article upon agricultural implements, published in the annual report of the Department of Agriculture, by the Hon. M. L. Durlap, of Illinois, we are pleased to see that invention in this branch has not been stationary during the war. Among the principal competitors for public favor in prairie farming, to which his remarks chiefly relate, are the rotary spade with horse power, which promises to be more effective than the steam-plough with traction engines, the latter having thus far proved a failure in moist or cultivated soils; the steel-clipper plough, with polished cast-steel mold-board; the two-horse cultivator or plough; the iron roller; the hand sowing machine; reaping and mowing machines, separate or uncombined; the sulky,

wire-tooth horse hay-rake; the horse hay-fork or patent pitchfork; the horse-power thresher with straw-carrier and bagging apparatus attached; the drain plough; the portable farm mill and the sorghum mill. But the statistics of the eighth census will measure the public appreciation of these and other new productions of American skill, and their influence upon the rural economy of the nation.

"The cash value of farms under actual cultivation in the United States in 1850 was \$3,271,575,426. Their value had risen in 1860 to \$6,645,045,007, an increase of 103 per cent. in ten years. The amount of capital invested in implements and machinery for their cultivation in 1860 was \$246,118,141, having in ten years increased \$94,530,503, or more than sixty-three per cent. Thus, the fixed capital of the agriculturists in farms, and in farm tools and machinery, both increased in a ratio much more accelerated than that of the population, which during the same time augmented at the rate of only thirty-five and one-half per centum. If we suppose the rural population to have increased in the same proportion to the whole, and the productiveness of the soil to have remained unchanged, we shall perceive that an immense increment of productive force accrued to the nation within ten years in the mechanical appliances of agriculture alone. Taking the aggregate number of acres of improved lands in the United States to be, in round numbers, one hundred and sixty-three millions, as shown by the returns, it would thus appear that the average value of farm implements and machinery for each farm of one hundred acres is only about \$150, which is probably less than one-third the sum that could be so invested with profit, at least in the older settled States. The greatest deficiency in this respect is found in New England, where it is only \$1 34 per acre, probably due to the ruggedness of the country. In the middle States the value of machinery employed is \$2 07 per acre; in the western States \$1 56, and in the southern \$1 48 per acre. Notwithstanding the evidence, therefore, of an improvement in the quantity and quality of implements, and inferentially of a better system of farming, there is manifestly room for further improvements in this respect, and ample encouragement to our agricultural machinists to supply the growing demand.

"The production of labor-saving machinery, as will be shown by the tables of manufactures, was still going on to the amount of \$17,487,960 in 1860, which was likewise an increase of nearly 156 per cent. over the value made in 1850, when it reached the sum of \$6,842,611. This was exclusive of all articles made on the farm, which was formerly considerable, but is yearly decreasing as regular manufactories and depots for the sale of farm implements are multiplied, and their cost diminished. It also excludes cotton-gins, scythes, hoes, shovels, spades, forks, and some other articles of hardware, wagons, carts, and wheelbarrows, the value of which amounted to \$11,796,941, and might appropriately be added to the above table.

"Of the total product in 1860, nearly two millions in value was made in New England, being an increase of about sixteen per cent. upon the returns of 1850.

"The middle States increased their production from less than two and a quarter to upward of five and three quarter millions, or 134.2 per cent. The great States of New York and Pennsylvania returned, the one 333, and the other 260 establishments devoted to this branch of manufacture, and the increase in their product was 172.7 and 85.5 per cent., respectively, over the business of 1850.

"In the western States the increase was most extraordinary, the value having augmented from \$1,923,927 to \$8,707,194, or 352.5 per cent. Their total production was nearly one-half that of the whole Union. Its increase alone was nearly thirty-nine per cent. of the whole, and nearly equalled the total manufacture of the United States in 1850. The States of Ohio and Illinois, together, manufactured to a greater amount than any other two States in the Union, the value amounting in the former to \$2,820,626, and in the latter to \$2,379,362, and the increase to 405.5 and 212.2 per cent., respectively. Iowa increased its manufacture 1,208.6 and Kentucky 755.4 per cent. over the product of 1850.

"In the southern States the aggregate was but little over one million, and the rate of increase nearly thirty per cent. Virginia was the largest manufacturer, but in several there was a falling off from the product of 1850, after excluding cotton-gins, &c., as before mentioned.

"The largest amount manufactured in any one county in 1860 was in Stark county, Ohio, in which fifteen establishments produced \$900,480, the larger part of which consisted of mowers and reapers, and of threshing machines and separators, in each of which three factories were employed. The next largest county production in this branch was in Cook county, Illinois, which made to the value of \$529,000, chiefly in the city of Chicago. Of that sum, \$414,000 was the value of 4,131 reapers and mowers made by a single establishment, the largest in the country. Rensselaer and Cayuga counties, in New York, each produced upward of \$400,000 worth of agricultural implements, and a single firm in Canton, Stark county, Ohio, made reapers, mowers, and threshers to the value of \$399,000.

"From the New England States there is a considerable exportation of agricultural implements to the British provinces, the southern States, and other parts of the world.

"That the large rates of increase in this branch indicated by the foregoing figures are not due simply to the increase of population, is shown by the fact that in Illinois, whose rate of increase with so large a population is without a parallel, the increase in value of agricultural implements manufactured in 1860, as compared with 1850, was 212 per cent., while the increase of population during the same period was only 101 per cent. In Ohio the population increased only 18.14 per cent., while its production of agricultural implements was augmented 417.6 per cent.

"We subjoin a summary of the progress of invention in relation to a few of the more important instruments of this class, having given in the preliminary report an account of the progress in threshing implements.

"THE PLOUGH.—Could the history of this machine, the type and pioneer of all other implements of husbandry, be traced from its origin, it would probably be found that few agricultural utensils have undergone greater modifications, or been more slowly improved than the plough. Originally, nothing more than the rude branch of a tree, with its cleft and curved end sharpened to scratch a furrow for the seed, possibly, as suggested by the ingenious Tull, in imitation of the tillage effected by

swine, the instrument appears at this time to have been brought as nearly to perfection as it is possible to attain. The primitive plough, a 'mere wedge with a short beam and crooked handle,' became in time fitted with a movable share of wood, stone, copper or iron, wrought to suitable shape, as we find it in the hands of our Saxon ancestors. To this a rude wooden mould-board to turn the furrow was afterwards added, and, with various improvements in shape, continued in use until near the present time.

"What was its form or efficiency in the days when Elisha was summoned from ploughing with twelve yoke of oxen, to assume the mantle and functions of the Hebrew prophet, may not be quite apparent, but the plough was certainly hundreds of years in reaching the imperfect state above described, and was several hundred more in approximating its present improved condition. In the middle of the last century the ploughs of southern Europe had been little improved, and were still destitute of a coulter, as in the old Roman plough of the days of Virgil and Columella. It has received few modifications there down to this time. Even in England, at that period, the plough was an exceedingly rude and cumbersome affair compared with the best now in use. It was no uncommon thing in parts of the island thirty years ago to see from three to five horses in light soils, and in heavy ones sometimes as many as seven attached to a plough, which turned about three-quarters of an acre per diem. The old Scotch plough was still worse, and in Scotland, where agricultural machinery is now most perfect, no instance was known of ploughing with less than four horses. The usual number was six horses, or four horses and two oxen, and sometimes as many as ten or twelve were yoked to it, each requiring a driver. William Dawson, soon after 1760, introduced the custom of ploughing with two horses abreast with lines.\*

"Although the swing-plough is believed to have been the earliest used in Great Britain, one and two wheel ploughs—long used on the continent—were most in favor. Turn-wrest ploughs, drill, drain, and trenching ploughs, and others adapted to different uses, were employed in considerable variety.

"A capital improvement in the plough was the invention of the iron mould-board and landside. An approach to this was made by Joseph Foljambe, of Rotherham, England, who in 1720 took out the first patent of the kind recorded. It was for a mould-board and landside of wood sheathed with iron plates, the share and coulter being made of wrought-iron with steel edges. One of these patent or Rotherham ploughs—as all similar ones were called for many years—was imported and used for some time with much satisfaction by General Washington, but, becoming worn, our ploughwrights were unable to repair it. The ploughs used in New England early in this century, and more recently in the south, were of similar construction. About the year 1740 James Small, of Berwickshire, in Scotland, first introduced the cast-iron mould-board, still using wrought-iron shares. During fifty years he continued to manufacture and improve the Scotch swing-plough, which, since made wholly of iron, has long been regarded as the best in use in England. In 1785 Robert Ransome, of Ipswich, introduced cast-iron shares, and about 1803 made improvements still in use, by making the cutting edges of chilled iron harder than steel, by casting them in moulds upon bars of cold iron. The making of the first iron plough has been attributed to William Allan, a farmer of Lanarkshire, in Scotland, in 1804, but an iron plough was presented to the Society of Arts in London as early as 1773, by a Mr. Brand. The cast-iron plough was introduced soon after. Like most other improvements in rustic machinery, the iron ploughs, though doing much superior work at less than half the expense of the clumsy wooden plough of that date came tardily into use. It is said that Sir Robert Peel, in 1835, having presented a farmer's club with two iron ploughs of the best construction, found on his next visit the old plough with wooden mould-boards again at work; 'Sir,' said a member, 'we tried the iron, and be all of one mind, *that they made the weeds grow.*'† A similar prejudice opposed the introduction of the first cast-iron plough in America, patented in 1797 by Charles Newbold, of New Jersey, who, after spending, as he alleges, \$30,000 in trying to get it into use, abandoned the attempt, the farmers declaring that iron ploughs poisoned the soil and prevented the growth of crops.

"The plough has received many improvements at the hands of Americans, and has become an article of frequent exportation, while even in Great Britain the ploughs now used are generally made after American models. The year 1617 is mentioned by an early annalist as the 'remarkable period of the first introduction of the labor of the plough' in Virginia. In 1625 we find the Dutch colony on the Hudson supplied with 'all sorts of seeds, ploughs, and agricultural implements,' to which in 1662 was added a first-class wheel-plough with its pulleys, &c., at a cost of sixty florins. In 1637 the colony of Massachusetts contained but thirty ploughs, and Connecticut probably less than one-third the number. Nevertheless, the same year a resident of Salem was promised an addition of twenty acres to his original grant if he would 'set up ploughing.' We involuntarily think of the steam-plough when we read that another citizen of that town in the following year was allowed more land because he had 'not sufficient ground to maintain a plough' on his farm of 300 acres. Owing to the scarcity of mechanical labor, most of the ploughs and other farm utensils were for a long time made on the farm, with the aid of the nearest smith. The casting of plough-irons was done at nearly every small foundry. Their make was, of course, clumsy and inefficient. Among the kind still remembered by many was the Cary plough, with clumsy wrought-iron share, wooden landside and standard, and wooden mould-board plated over with sheet-iron or tin, and with short upright handles, requiring a strong man to guide it. The bar-share plough was another form, still remembered by many for its rudely fitted wooden mould-board and coulter, and immense friction from the rough iron bar which formed the landside. The Bull-plough was similar in form, but without a coulter. Even the shovel-plough, not unlike the rude instrument still used by the Chinese, may be remembered by some, and was in common use in the cotton States a few years since. As early as 1765 the London Society of Arts awarded a gold medal to

\*McCulloch's Statistics of British Empire.

†Phillips' History of Progress in Great Britain.

Benjamin Gale, of Killingworth, Connecticut, for a drill-plough, the invention of which was claimed by Benoni Hilliard, of the same place. The first patent taken out after the organization of the United States Patent Office was in June, 1797, by Charles Newbold, of Burlington, New Jersey, for the cast-iron plough already mentioned, which combined the mould-board, share, and landside, all in one casting. He afterwards substituted wrought-iron shares, objections having been made to the cast-iron probably because not chill-hardened. He did not succeed in getting them into permanent favor, although cast-iron ploughs were advertised for sale in New York in the year 1800, by Peter J. Curtenius, a large iron founder of the city. Newbold was paid one thousand dollars by David Peacock, a fellow-townsmen, who, in April, 1807, patented a modification of the iron plough, having the mould-board and landside cast separate, with a wrought-iron steel-edged share attached.

"As early as 1798 Mr. Jefferson also exercised his mechanical tastes in improving the mould-board of ploughs, which he afterwards adapted to an improved plough sent him by the Agricultural Society of the Department of the Seine, in France. His son-in-law, Mr. Randolph, whom Mr. Jefferson thought probably the best farmer in Virginia, invented a side-hill plough adapted for the hilly regions of that State, and designed to turn horizontally, in the same direction, the sides of steep hills, which, in northern Europe, was effected by a shifting mould-board, constituting the variety called turn-wrest ploughs. Colonel Randolph's plough was made with two wings welded to the same bar, with their planes at right angles to each other, so that by turning the bar, adjusted as an axis, either wing could be laid flat on the ground, while the other, standing vertically, served as a mould-board. Mr. Jefferson advocated an adherence to scientific principles in the construction of the plough. Perhaps the first attempt to carry out these suggestions was made by Robert Smith, of Pennsylvania, who, in May, 1800, took out the first patent for the mould-board alone of a plough. It was of cast-iron, and of improved form, the principles of which were published by him. In July, 1814, Jethro Wood, of Scipio, New York, was granted a patent for a cast-iron plough having the mould-plate, share, and landside cast in three parts. The mould-plate combined the mechanical principles of the wedge and screw in raising and inverting the furrow-slice. It became the foundation of many patented improvements of later date, and of a handsome competence to the inventor, who, in 1819, received a second patent, which was renewed by act of Congress in 1832.

"A series of improvements in the cast-iron ploughs was commenced about 1810 by Josiah Ducher, of New York, which were patented in 1822. Some of them are still retained in use. Two improvements in cast-iron plough, designed to make it easier of draught, were covered by letters patent issued in April, 1821, to A. L. & E. A. Stevens, of Hoboken, New Jersey. One of these was for hardening the cutting-edges and parts exposed to wear by cold-chilling them. Four other patents on the cast-iron plough were granted the same year. Much credit is also due to Joel Nourse, of Massachusetts, and his partners, for improving and perfecting the cast-iron plough, which was comparatively a rude instrument, in limited demand, as late as 1836, when they commenced the manufacture of agricultural implements at Worcester. The sale of twenty thousand ploughs in a single year by this firm, within twenty years after they commenced business, indicated the increased demand for ploughs, which they were able to supply, of one hundred and fifty different forms and sizes. Among these were *subsoil* ploughs adapted to teams of from one to six horses, the first implement of that kind in the United States having been imported by them in 1840 from Scotland, and subsequently improved by making it more simple, light, and cheap in construction. American hill-side ploughs are now exported to Great Britain. The number of patents granted for ploughs previous to 1830 was 124, and up to 1848 had reached between three and four hundred.

"A distinctive feature in American ploughs is their great simplicity, lightness of draught, neatness, and cheapness, which is often in striking contrast with those of foreign make. This economy of power attracted attention to two ploughs sent, in 1815, to Robert Barclay, of Bury Hill, near Dorking, in England, by Judge Peters, president of the Philadelphia Society of Agriculture, the seal of which society, by the way, bears as a device a representation of the plough of the date of 1785. The ploughs referred to were made by order of Mr. Peters, to combine the best principles and forms of American ploughs, and when tested in August of that year against the best English ploughs, were found to do the work quite as well and as easily with two horses as the others did with four. American ploughs obtained favor with English farmers for substantially the same characteristics, namely, 'extraordinary cheapness and lightness of draught,' at the trial of ploughs at Hounslow during the great exhibition in 1851.

"In the early part of this century the manufactories of ploughs in the United States were few and small in size. It has since become an important branch of the agricultural implement business. Ploughs were made and exported in considerable quantity at Enfield, Connecticut, previous to 1819. One of the largest establishments in this or any country, devoted chiefly to plough-making, was established in Pittsburg, Pennsylvania, in 1829. In 1836 it made by steam-power one hundred ploughs daily, of patterns adapted largely for the lower Mississippi, and cotton and prairie lands of the south and west. The iron-centro plough, and hill-side revolving beam-plough, were among the valuable modifications originated by the concern which now makes also the steel ploughs so valued in prairie farming. Another steam-plough factory in Pittsburg made in 1836 about 4,000 ploughs annually, including wood and cast-iron ploughs, and a great variety of other kinds. These two factories, together, made 34,000 ploughs yearly, of the value of \$174,000. There are several other extensive and numerous smaller manufactories throughout the country, particularly in the western States, in which plough-making is carried on as a specialty. It forms, however, a branch of the general manufacture of agricultural implements. In the best conducted of these, machinery is extensively employed, and such a division of labor as to secure great speed and perfection of workmanship, as well as a great reduction of the cost. For each size and pattern of plough, the several parts subject to wear are made alike, so as to fit any plough of that class, and allow it to be readily replaced without the aid of the plough-wright. Sulky ploughs, with a seat for the driver, and gang-ploughs, cutting several furrows at a time, have been introduced, but have not proved generally satisfactory. Rolling or

## INTRODUCTION.

wheel coulters have, in many cases, taken the place of the old standing coulter. Many ploughs now have a hook attached for turning the weeds under the furrow, an important improvement for prairie farms, where weeds, like other vegetation, are luxuriant.

"Several attempts were made in 1858 and the following years to introduce steam-ploughs, for which the Illinois Central Railroad Company offered a premium of \$3,000. They have been employed with success for several years in Great Britain. English steam-ploughs are operated by stationary engines placed at one side of the field, and draw the plough from one side to the other by means of wire-chains. At other seasons the engines are used in driving threshing-machines and performing other farm labor. Our inventors have employed traction engines of several tons weight, which on hard ground worked satisfactorily but on cultivated or moist soil were found to bury themselves inextricably in the ground. They appear to have been abandoned for the present.

"A more recent machine, which promises to be a valuable one, is the rotary-spader, which, with the power of four horses, spades the ground eight inches deep and three feet wide, at the rate of five or six acres a day. It is rather too costly for small farms, but on large ones may prove valuable, and in time may be adapted to steam-power.

"Many improvements have been made in implements for cultivating corn and other hoed crops, among which the horse-hoe or cultivator is exceedingly popular, and in corn-growing districts has nearly supplied the loss of manual labor by the war. The importance of frequently stirring the soil is becoming better understood, and in our dry climate the effects of severe drought may be almost entirely obviated by the use of the cultivator on rich, well prepared-lands.

## MOWERS AND REAPERS.

"These implements, making so large an item in the manufacture, deserve a brief notice. The great breadth of land devoted to grain in the western country has rendered mechanical appliances for gathering the crop altogether indispensable to the farmer. But contrivances for that purpose have long been in use. Pliny the elder, in the first century of our era, gives us the earliest description of such an instrument in use among the Gauls. It was a large van, or cart, driven through the standing corn by an ox yoked with his head to the machine, which was fitted with projecting teeth upon its edge for tearing off the heads, which dropped into the van. It is supposed to have been in use for several centuries.

"The earliest proposal in Great Britain for an implement for harvesting grain was made by the Society of Arts in 1780, when it offered its gold medal for a machine to answer the purpose of mowing or reaping grain, simplicity and cheapness in the construction to be considered as the principal part of its merit. The premium was continued for several years. William Pitt, of Pendeford, soon after invented a reaping machine, suggested by the description of Pliny and Palladius, and described in Young's Annals of Agriculture for 1787. A second attempt was made in Lincolnshire, in 1793, by another person, whose name does not appear. In November of that year, two men named Cartwright, each invented a machine for mowing and reaping. In 1799 the first English patent was taken out by Joseph Boyce for a reaping machine, acting on the principle of the common scythe. In the following year, Robert Mears, of Somersetshire, was granted a patent for a reaping machine propelled on wheels, but worked by hand. In June, 1805, Thomas J. Plucknett, of Kent, received a patent for a reaper having the cutting apparatus suspended beneath and in front of the axle, and the power behind. He took out a second patent in 1807. Mr. Gladstone, of Castle Douglas, in 1806 invented a machine with horizontal gathering-wheel, and the next year Mr. Salmon, in Bedfordshire, brought forward a plan for raking the corn off a platform by means of a vertically-working rake driven by a large crank in the rear of the machine. Messrs. Kerr, of Edinburgh, in 1811 introduced the 'conical drum,' and in 1815 Mr. Scott employed rakes with a cylindrical drum, and projecting teeth, &c. In 1822, Mr. Ogle, of Alnwick, invented the large reel or rake for lashing the uncut grain towards the knife, as is now done in some English and American reapers. Some others were brought forward previous to 1826, in which year the Rev. Patrick Bell, of Scotland, produced the oldest machine now known to be in use, having a revolving apron or endless web for gathering, accompanied by Ogle's reel in front, which attracted little attention, however, until after the London exhibition in 1851, when he adopted McCormick's cutting apparatus; since which it has been used to some extent. From the closing of the fair in 1851, to the end of 1852, no less than twenty-eight patents were registered in England for inventions relating wholly or in part to reaping and mowing machines. Patents had been previously granted for this class of machines in Russia in 1831, in Austria in 1839, and in Australia in 1845. The last mentioned, introduced at Adelaide, South Australia, by Mr. Ridley, reaped, threshed, and winnowed all at the same time, at the rate of an acre per hour; but its description conforms very nearly to one patented by D. A. Church, of Friendship, New York, in 1841. Whether from intricacy of construction, or other inherent defect, or, as seems more probable, from indifference on the part of the public, none of these instruments came into permanent use, although they provoked the opposition of agricultural laborers.

"The first American patent for cutting grain was issued in May, 1803, to Richard French and J. T. Hawkins, of New Jersey. Their machine was propelled on three wheels, one of which extended into the grain. Samuel Adams, of the same State, followed in 1805; J. Comfort, of Bucks county, Pennsylvania, and William P. Claiborne, of King William county, Virginia, in 1811; Peter Gaillard, of Lancaster, Pennsylvania, 1812, and Peter Baker, of Long Island, New York, in 1814. The next was the machine of Jer. Bailey, of Chester county, Pennsylvania, patented in February, 1822, which was a rotary mowing machine, having six scythes attached to a shaft. Four other patents were registered previous to 1828, when Samuel Lane, of Hallowell, Maine, patented a machine for cutting, gathering, and threshing grain all at one operation. It does not appear, however, to have been successful. Only one other machine, that of William Manning, of Plainfield, New Jersey, registered in 1831, and having several points of resemblance to some now in use, was patented previous to that of Obed Hussey, of Cincinnati, Ohio,

in December, 1833. The first public trial with this instrument was made before the Hamilton County Agricultural Society, near Carthage, July 2, of that year. During the next it was introduced into Illinois and New York; in 1835 into Missouri; in 1837 into Pennsylvania; and in 1838 the inventor established his manufactory at Baltimore. In June, 1834, Cyrus H. McCormick, of Rockbridge county, Virginia, received his first patent for cutting grain of all kinds by machinery, which was worked in 1831, and since improved, proving a source of large profit to the proprietor, as well as a great boon to this country and foreign lands. From that time to the present nearly every year has produced one or more modifications of harvesting machinery, among which may be mentioned that of Moore & Haskell, of Michigan, patented in June, 1836, which cuts, threshes, and winnows grain at the same time. From the date of this patent to the issue of McCormick's second patent, in 1845, fifteen other machines were registered, including that of W. F. Ketchum, of New York, in 1844, which has since obtained a high reputation. Since 1851, the new machines brought forward have been numerous. In June, 1852, twelve different reaping machines and several mowers were entered for trial before the Ohio State Board as contestants for the premium, all of them—including McCormick's and Hussey's—possessing nearly equal merits.

"The United States Agricultural Society, in 1857, instituted an elaborate trial of reapers, mowers, and implements, which took place at Syracuse, New York, in July of that year, when fifteen mowing machines, nine reapers, and fourteen combined mowing and reaping machines were entered. Medals and diplomas were awarded to several. Among those entered were Pell's, Manny's, Haines's, (Illinois Harvester,) W. A. Woods's, (J. H. Manny's improved,) Seymour & Morgan's, Burrall's, Warder, Brokaw & Childs's, Atkins's, (automaton self-raker,) Moore & Patch's, and C. H. McCormick's, for reaping alone. Mowing machines were entered by several of the same inventors, and also by Heath, Ketchum, Ball, Aultman & Miller, Hallenbeck, Kirby, Hovey, Allen, and Newcomb, and combined machines by some of the same parties, and by A. H. Caryl, Obed Hussey, J. H. Wright, and Dietz & Dunham.

"The whole number of harvesting machines produced in England and the United States up to that time amounted to 160 different kinds, about 100 of which were American; and in October, 1854, it had reached about 200.

"The progress of ideas, or the different channels in which they have run, in regard to the mode of action of the cutters of reaping machines, has been shown by Bennett Woodcroft, esq., of England, in a patent office publication containing illustrations of sixty-nine examples of reapers, including nine American machines. In thirty-one of the number the motion of the knives was rectilinear, and in thirty-three it was circular, while in five the knives were moved by hand. Previous to the introduction of American reapers, the tendency in England was toward a circular action of the cutters; since that time reciprocating motion has been more employed. Although reciprocating and rectilinear motion was used by Salmon, in 1807, only two of the English machines introduced previous to 1862, namely, Ogle's and Bell's, were examples of that kind of motion, and three American, namely, Manning's, Hussey's, and McCormick's, while there were twenty-one of the other kind. Of later examples there were seventeen with reciprocating-motion, to eleven with circular.

"Diversities have also existed as to the mode of gearing the horse. Pitt's, Boyce's, Plucknett's, and Gladstone's machines were drawn behind the horses; Salmon's, Kerr's, Hark's, and other early English machines, were pushed before the horses, after the manner of the Romans and Gauls. In America both plans have been used, but since 1833 they have usually been placed behind the horses. By recently proposed improvements, horse-power harvesting machines with four horses will cut twenty acres of grain in a day, at a net cost—including eight dollars for the use of the machine, a driver, two binders, and two hands to shock up—of ninety cents an acre, which harvested by hand would cost \$1.90 per acre. The binding is now sometimes done with wire on the large grain-fields of the west, and a machine has lately been invented for performing that part of the labor. There can be little doubt that we shall soon have machines that will cut, gather, and bind up the grain at one operation. American reaping and mowing machines have now been introduced into every civilized country. Their usefulness has been universally acknowledged. In our own land, where labor is so high, and the season so short, they are indispensable. In many sections the labors of sowing and planting the spring crops are quickly followed by haying and harvesting. Corn, beans, potatoes, and other crops require the use of the hoe and cultivator. Summer fallows, for wheat, claim attention at this time; and no sooner is the labor of harvesting over, than the American farmer is under the necessity of sowing his winter wheat, which in the northern and western States is sown from one to two months earlier than in England.

"The nature of our climate, the character of our crops, the scarcity of labor, and the extent of our agricultural operations, all conspire to increase the introduction and use of these and all other implements and machines that will expedite the labors of the farm.

"It is difficult to conceive that American agriculture could have attained its present condition had the invention of reaping and mowing machines been delayed thirty years. The extent to which they are already used is enormous.

"The editor of the Genesee Farmer, Rochester, N. Y., has collected directly from the manufacturers the following statistics of the number of reaping and mowing machines made by a few of the leading firms engaged in this important branch subsequent to the returns of the census in 1860.

"C. Aultman & Co., Canton, Ohio, made last year (1863) 3,100 'Buckeye' mowing and reaping machines, and this year (1864) 6,000 of the same machines.

"Bomberger, Wight & Co., of Dayton, Ohio, have made 1,250 'Ohio Chief' reapers; Rufus Dutton, who formerly manufactured the same machine, has made 3,156, making 4,306 in all.

"Of the 'Manny' reaping and mowing machine there have been manufactured in the State of Illinois, up to 1863, about forty thousand. In 1864 there have been made of the same machines in Rockford, Illinois, 10,500.

"Messrs. Adriance, Platt & Co., of Poughkeepsie, New York, have also made 2,500 'Manny' machines for the New

England States. The same parties have also manufactured 1,100 'Buckeye' machines for the New England States, New Jersey, &c.

"S. M. Osborne & Co., of Auburn, New York, have made 15,000 of 'Kirby's' mower and reaper. The Buffalo Agricultural Machine Works have also made 7,000, and other parties have made 5,000, making 27,000 of these machines that have been manufactured in the United States.

"Messrs. Seymour, Morgan & Allen, of Brockport, New York, have made 7,200 of their 'New Yorker' and other machines. Messrs. Warder & Childs, of Springfield, Ohio, also manufacture the same machine, and have made about 9,000.

"The Messrs. McCormick Brothers have manufactured at their establishment in Chicago over 55,000 of their celebrated reaper—6,000 in 1864.

"The establishment of Mr. R. L. Howard, of Buffalo, New York, has manufactured 20,000 of the 'Ketchum' mowing machines, and 5,000 reapers and mowers combined, and 3,500 of the 'Howard harvesters.'

"Mr. Walter A. Wood, of Hoosick Falls, New York, has made over 30,000 reaping and mowing machines. In 1858 Mr. Wood sent an agent to England with fifty; the next year he sent two hundred and fifty machines, and since then his sales in Great Britain and on the continent of Europe have averaged over 1,000 per annum.

"It thus appears that the manufacturers we have named have made two hundred and fourteen thousand and ninety-four mowers and reapers.

"We present these facts, obtained directly from the manufacturers, that our readers may form some idea of the magnitude of the reaper and mower business. There are other machines manufactured of which we have not ascertained the number, but we may safely conclude that there have been two hundred and fifty thousand reaping and mowing machines manufactured and in use in the United States; the importance of which may be estimated, when it is considered that a common reaper will cut from ten to twelve acres in a day of twelve hours, and a mower eight to ten acres in the same time.

"Another valuable implement for facilitating harvesting operations is the hay-unloading fork, with which, by the aid of a horse, a load of hay can be elevated to the stack or mow in a few minutes. Several varieties of these useful little machines are manufactured, and tens of thousands are already in successful use.

"The wooden revolving hay-rake (invented by Moses Pennock, of Pennsylvania, in 1824, and now well known in all parts of the country) also greatly lessens the labor of haying. Fine steel-toothed rakes leave less hay on the ground, but for general use on American farms this wooden revolving hay-rake is one of the most simple, useful, and efficient machines yet invented. On large farms, the sulky wire-tooth rake is fast superseding all others. They throw the windrow into heaps or bundles of eighty or one hundred pounds each, ready for cocking or loading. A boy and horse can thus rake and bunch twenty acres a day. The hay-fork, or patent pitch-fork, is another recent improvement of value.

"For THRESHING AND CLEANING GRAIN, we have machines which are confessedly unsurpassed. In our preliminary report we gave an outline of the progress of invention in this class of implements.

"Nearly all threshing machines now in use have an apparatus for separating the grain from the straw and chaff, and carrying the straw up on to the stack. This simple apparatus is now so common that it attracts no notice, except from the English or continental visitor, to whom it is a novelty. Many machines have also an apparatus for bagging the grain when clean.

"The English threshing machines, especially those drawn by steam, have a much more finished appearance, but for simplicity and efficiency they are in no way superior to those of American manufacture. In fact, wherever the American threshing machines have come into direct competition with those of British and European construction, the American machines have proved superior.

#### SCYTHES.

"Although the genius of modern improvement promises ere long to rob hay-making of one element of the picturesque, it has not yet wholly succeeded in banishing the hand-scythe and mower from modern scenery. Tedious and laborious as its use appears, compared with that of the mowing machine, it is wonderfully effective in comparison with the rude practice of the Mexican of our day, who cuts his grain and hay by handfulls with a common knife. It may not be generally known that the most valuable improvement made upon this implement for centuries was by one of the first iron-workers of Massachusetts, more than two hundred years ago, in the very infancy of the colony. In the year 1646 the general assembly of that province granted to Joseph Jenckes, of Lynn, a native of Hammersmith, in England, and connected with the first iron-works in that colony, the exclusive privilege for fourteen years "to make experience of his abilities and inventions for making," among other things, of "mills for the making of scythes and other edge-tools." His patent "for ye more speedy cutting of grasse" was renewed for seven years in May, 1655. The improvement consisted in making the blade longer and thinner, and in strengthening it at the same time, by welding a square bar of iron to the back, as in the modern scythe, thus materially improving upon the old English scythe then in use, which was short, thick, and heavy, like a bush-scythe.

"The introduction of the scythe and axe manufacture into Massachusetts, Connecticut, and Rhode Island, is to be in a great measure ascribed to Hugh Orr, a Scotchman by birth, who came to Massachusetts about 1737, and a year or two after erected at Bridgewater the first trip-hammer probably in the colony. He engaged in the manufacture of scythes and other edge-tools, in which he acquired a wide reputation. His son, Robert Orr, by successful experiments, established the improved manufacture of scythes by the trip-hammer, and also introduced the iron shovel manufacture into the State. As early as 1766 samples of home-made scythes, shovels, spades, hoes, &c., were laid before the Society of Arts, in New York, and approved.

They were probably from the manufactory of Keen & Payson, of that neighborhood, whose improved scythes, often called Salem scythes, then claimed to be superior in quality and form to any others. The non-importation and non-intercourse of the revolutionary period, and during the last war with England, encouraged the domestic manufacture of scythes and other articles of hardware, which, before the end of the last century, were made in different parts of New England in considerable quantity. Scythes were made in Plymouth county, Massachusetts, and to the number of two or three hundred dozens annually, at Canton, in Norfolk county, and also at Sutton, in Worcester county, which town had in 1793 seven trip-hammers and five scythe and axe factories. In 1810 there were nine factories in Sutton, and two in Oxford, and in 1814 seven others had been erected in the county, some of which could make 1,000 dozens annually. Scythes were at the same time made in Boston, and in 1803 the manufacture was commenced at Orange, by Levi Thurston, who employed in it the first tilt-hammer in the town. A few years later there were two scythe factories at Colebrook, in Litchfield county, Connecticut, which county in 1820 returned the largest manufacture of scythes of any in the Union. At Southfield, Rhode Island, large numbers of scythes were made at that time for exportation. As early as 1812, the scythe factory of S. & A. Waters, at Amsterdam, in Montgomery county, New York, turned out about 6,000 scythes annually. They were made at many small establishments throughout the Union, along with axes, sickles, and other edge-tools and cutlery, shovels, &c., by the aid of the trip-hammer, and were in good demand. The price in 1820 ranged from twelve dollars to eighteen dollars per dozen.

"About the latter date was commenced, at West Fitchburg, Massachusetts, one of the oldest scythe factories now in the country, then owned by F. T. Farwell & Co., which in the hands of its original and later proprietors has originated many improvements in the manufacture, and given reputation to its well-known brand. At a later period, Harris's scythes, extensively manufactured at Pine Plains, in Dutchess county, New York, obtained a high repute, and are said to have been counterfeited in England. The mammoth scythe factory of R. B. Dunn, at North Wayne, in Maine, was a few years ago considered the largest in the world. In 1849 it turned out 12,000 dozens, requiring 450,000 pounds of iron, 75,000 pounds of steel, 1,200 tons of hard coal, 10,000 bushels of charcoal, 100 tons of grindstones, and half a ton of borax. About the same time, the scythe and cast-steel fork manufactory of D. G. Millard, near the village of Clayville, New York, made about 13,000 dozens of scythes and forks annually, by water-power. In 1860 Massachusetts was the largest producer of scythes, returning \$168,550 as the aggregate value of the product of ten establishments. Maine ranked second in the value of its scythe manufacture—\$129,363 by three factories. In New York, four establishments turned out scythes worth \$117,440, and one factory in Rhode Island employed 100 hands, producing to the value of \$100,000. The total value of scythes made in 1860 was \$652,753, which was the product of twenty-two factories and 474 hands.

#### SHOVELS, SPADES, HOES, AND FORKS.

"These articles, intimately but not all so directly connected as the foregoing with agriculture, in 1860 gave employment in five States, to forty-three establishments, the value of whose manufacture was \$1,452,226. The hands engaged in them numbered 1,015. Upward of one-half the whole value was made in eleven factories in Massachusetts, which, together, employed 578 workmen, and produced an annual value of \$777,048, being relatively much the largest concerns in the country. In New York there were twenty-three manufactories, whose product was \$307,428, and the number of hands employed 233. Six factories in Pennsylvania employed 177 men, and produced wares to the value of \$312,450.

"The manufacture of these articles has long been an established industry in Massachusetts and some other States, having been commenced before the Revolution. The shovel manufacture was successfully introduced at an early period at Easton and Bridgewater, in Massachusetts, where the Messrs. Orr, before mentioned, were instrumental in establishing it by the use of the tilt-hammer. In 1788 the iron-plate shovels made at Bridgewater were deemed superior in workmanship to the foreign article which they undersold. The Easton shovel manufactory—commenced on a small scale nearly sixty years ago by the late Oliver Ames—made in 1822 about 2,500 dozen annually. The proprietor in 1827 took out a patent for improvements in the manufacture, which contributed to give his wares a high reputation, and greatly to extend and perfect the business of his establishment. In 1835, Oliver Ames & Sons had large manufactories at Easton, Braintree, and West Bridgewater, which employed nine tilt-hammers, and were capable of making forty dozen spades and shovels per diem, each shovel passing through the hands of twenty different workmen. They now run twenty-six tilt-hammers, and produce two hundred and fifty dozen per diem. In 1822 three factories in Plymouth county, Massachusetts, made from one to two thousand dozens each per annum. In 1831, it was estimated that about 5,000 dozens of shovels, worth \$35,000, were made in New York State annually. It was computed that Litchfield county, Connecticut, at the same date made shovels and spades to the value of \$6,500, hoes worth \$7,150, pitch-forks to the value of \$20,000, and scythes valued at \$56,000. A steel shovel and spade factory in Philadelphia consumed annually about fifty tons of American steel. The sheet-iron shovel was patented in 1819, and cast-steel shovels in 1828. The first American patent for improvement in hoes was registered in 1819, and for cast-steel hoes in 1827, by C. Bulkley, of Colchester, Connecticut. But cast-steel hoes were made in Philadelphia by at least two manufacturers in 1823. In Pittsburgh, Pennsylvania, where scythes, sickles, hoes, shovels, and other hardware were made in considerable amount previous to 1803, Messrs. Foster & Murray carried on the manufacture by steam-power in 1813. On account of the fall in the price of iron and steel, superior steel hoes were made in Pittsburgh in 1831 for about \$4 50 per dozen, or one-half the price of iron hoes ten years before. Socket-shovels were made at nearly the same price, which was about one-third their former price. Two large establishments in that place in 1836 made annually about 1,600 dozen steel hoes, 8,000 dozen of shovels and spades, 950 dozen steel and other hay and manure forks, and 600 dozen saws. Four establishments in 1857, in addition to nearly half a million dollars'

worth of axes, made 32,000 dozen of hoes, worth \$208,000, and 11,000 dozen of planters' hoes, worth \$94,000, besides picks, mattocks, vices, saws, &c. The Globe Sickle Factory, in the same place, produced a superior article of sickles to a greater value than all the other factories in the United States. The steel spring pitchfork was introduced by the late Charles Good-year, by whom it was patented in September, 1831, at which time, and for several years previous, he was engaged with his father, Amasa Goodyear, in the manufacture and sale of hay and manure forks, and other hardware. Their store in Philadelphia is believed to have been the first in the United States for the sale of American hardware exclusively; but the failure of the business during the commercial troubles of that period led the junior Goodyear to abandon it for the new manufacture of India-rubber goods, with which his name will be ever associated in the annals of industry.

"A firm in Philadelphia now manufactures eyeless or solid axes, hoes, picks, shovels, &c. The instrument is made solid, while the handle with which it is to be worked has upon the end an iron socket through which the pick, &c., is put, and kept in its place by an iron wedge. The handle does not become loose, and will answer for any number of tools of the same size, and the blow is rendered more effectual. Many of these tools have been exported to California, where they are prized by the miners.

"There can be no doubt that our agricultural tools, such as hoes, forks, rakes, &c., are in most respects superior to those in common use in Europe. An English gentleman, who has spent some time in this country, says: 'For lightness and finish, combined with strength and durability, American forks and hoes are superior to all others.'

"Dr. Lloyd, alluding to the great international exhibition in London, in 1861, says: 'Among the minor implements of agriculture, we were both surprised and gratified to find a collection of American forks and hoes. The exhibitor was a sensible English dealer, who, discovering the superiority of this class of American implements as compared with articles of the same description manufactured in his own country, has for years been importing and selling them to his customers. On being asked why English manufacturers did not make them, he replied: 'We can't do it; have been trying ever since the great exhibition of 1851, but somehow don't succeed. It is a mortifying admission to make, but it is nevertheless true, that you Yankees have a knack of doing some things which we have not the skill to imitate.'

#### COTTON-GINS.

"Although cotton-gins are made by a few establishments in the northern States, their manufacture is principally a southern one, and amounted in 1860 to the value of \$1,077,315, which was the product of fifty-five establishments, all but three of them southern. Alabama is the largest manufacturer of machinery for cleaning cotton, having sixteen factories, employing 178 hands, and producing gins to the value of \$434,805. Georgia ranks next, having twelve establishments, whose product exceeded a quarter of a million. The manufactures of cotton-gins in Mississippi are relatively the largest, three factories employing seventy hands, and returning an aggregate product of \$131,900. In Texas, where the first cotton-gin was erected about 1823, there are four manufactures of gins. Many of these machines are made in northern machine-shops, along with other cotton machinery, from which they are inseparable in the general estimate of value.

"The history of the cotton-gin furnishes one of the most remarkable examples on record of the power of a single labor-saving machine to influence the social and industrial interests, not merely of a single nation, but in a great measure of the civilized world. The simple mechanism of the saw-gin invented by Whitney enabled one farm-hand to separate the seed from 300 pounds of cotton fibre in a day, instead of one pound, as he had been able to do by hand. Its introduction at the particular period when the completion of the brilliant series of inventions for carding, spinning, and weaving cotton had created a demand for the raw material, at once directed into a new and profitable channel the agriculture of the south, and at the same time furnished the manufacturing industry of Europe and America with one of the most valuable staples, and the shipping and commercial interests of the world with an enormous trade in its raw and manufactured products. The increase in the growth and exportation of raw cotton which followed has no parallel in the annals of industry, save in the wonderful development of its manufacture in England and the United States. The effects of this growth of the husbandry and manufacture of cotton in increasing national wealth, in furnishing employment to labor and capital, and in increasing the comfort of all classes, can scarcely be conceived in all its magnitude.

"In 1792, the year preceding the introduction of the saw-gin, the amount of cotton exported from the United States was only 138,328 pounds, and the total domestic consumption was about five and a half millions of pounds. During the next year there were exported nearly half a million pounds; in 1794, 1,601,700 pounds; in 1795, 5,276,300 pounds; and in 1800, 17,789,803 pounds.\* In 1860 the production of ginned cotton in the southern States amounted to 5,198,077 bales of 400 pounds each, or 2,079,230,800 pounds, which was more than seven-eighths of the total production of cotton throughout the world. The quantity exported in that year was 1,765,115,735 pounds, equivalent to 4,412,789 bales of 400 pounds each. To prepare this large amount of cotton for market by the primitive methods would have been utterly impracticable. Not only is the labor of the planter facilitated and cheapened by the use of the machine, but the cotton is much better cleaned than by the old methods, which left it unsuitable for the finer fabrics.

"Although the earliest mode of separating cotton from the seed, and the one chiefly practiced in the cotton States previous to the invention of the saw-gin, was to separate the seed with the fingers, yet mechanical contrivances for that purpose have been long in use, having been chiefly borrowed from India, the cradle of the cotton culture and manufacture. In that country

the practice of beating out the seed was long in use. A more effectual modification of the same method, employed for centuries in eastern countries, and very early introduced into Georgia, which took the lead in cotton husbandry, was the bow-string operation. It consisted in the employment of a long bow fitted with a multitude of strings, which being vibrated by the blows of a wooden mallet while in contact with a bunch of cotton, shook the seed and dust from the mass. Hence upland or short staple cotton became known in commerce as 'bowed cotton.' A form of the roller-gin appears also to have been used in India in early times, as mentioned by Nearchus, and consisted of two rollers of teak-wood fluted longitudinally, and revolving nearly in contact. In 1728 we find mention of "little machines, which being played by the motion of a wheel, the cotton falls on one side, and the seed on the other, and thus they are separated."

"About the year 1743, M. Dubreuil, a wealthy planter of New Orleans, invented a cotton-gin which was so far successful as to give quite an impulse to the cotton culture in Louisiana, but nearly forty years later the colonial authorities in Paris recommended the importation of machinery from India for cleaning the seed.

"Early in the Revolution, Kinzey Borden, of St. Paul's parish, South Carolina, constructed a roller-gin, believed to have been the first ever used in that State for cleaning the long staple and silky cotton, of which he was one of the first cultivators. It consisted of pieces of burnished iron gun-barrels secured by screws to wooden rollers turned by wooden cranks, like a stool corn-mill. A Mr. Bisset, of Georgia, in 1788, contrived a gin having two rollers revolving in opposite directions, operated by a boy or girl at each, by which five pounds of cleaned cotton was made per diem. Nothing but hand-gins, resembling the cotton hand-mills of India, were yet known in the south, although foot or treadle gins appear to have been in use at this date in Philadelphia and vicinity, some cotton being then raised in New Jersey, Maryland, and Delaware. A great improvement in the treadle gin was made about the year 1790, by Joseph Eve, of Providence, Rhode Island, then residing in the Bahamas, and was patented by him in 1803. It was a double gin, with two pairs of rollers placed obliquely one above the other, and, by adding iron teeth and pulleys, was made by a little assistance to feed itself. It could be worked either by horse or water power. Mr. Pottle, of Georgia, substituted two single rollers for the double ones, and produced a gin very popular in that State for some time. The present form of foot or treadle gin was first introduced into Georgia from the Bahamas, in 1796. It was improved in 1820 by Mr. Harvie, of Berbice, who obtained a patent, and afterwards by another person, who obtained a patent in the United States for making the rollers hollow, to prevent them from becoming hot while revolving. Other improvements on the roller-gin were patented in 1823 and subsequent years by Eleazer Carver, of Bridgewater, Massachusetts, who in 1807 commenced the manufacture of saw and roller gins in Mississippi and Louisiana, then a new country without saw-mills—of which he erected one of the first in these territories—or any machinery for manufacturing the several parts. The Whittemores, of West Cambridge, also secured patents for improvements on the roller-gin, which was in some respects superior to all others, but was found to injure the staple, and was abandoned. Other modifications of these machines were introduced by Birney, Simpson, Nicholson, Farris, Logan, Stevens, McCarthy, and others, several of which were popular in their day, and preferred in certain sections of the cotton States. The machines of Farris and Logan were improvements upon Eve's mechanism, and at a recent period were still used to some extent with steam-power. Jesse Reed, of Massachusetts, inventor of the tack-machine, patented cotton-gins in 1826 and 1827, the latter for cleaning Sea Island cotton, and the eminent American inventors, Jacob Perkins and Isaiah Jennings, each labored in this field. The roller-gin is especially adapted for cleaning the long staple or Sea Island cotton, the long, silky, delicate fibre of which is injured by the saw-gin. In the original machines, a pair of rollers worked by one hand would make about twenty-five pounds of clean cotton in a day. A recent improvement by Mr. Chichester, of New York, consisting of a fluted roller of polished steel, and one of vulcanized rubber, &c., is said to clean 300 pounds per diem, without crushing a seed. The Parkhurst roller-gin, though costly, is deemed a superior machine in Alabama and other cotton districts. The Louisiana cylinder-gin for short staple cotton, made by Jenks, of Bridesburg, Philadelphia, is also much esteemed for completely removing all extraneous matters without injury to the fibre. But as the Upland short staple, or black-seed cotton, was the first variety cultivated in the south, a means of removing the seed from its tenacious envelope was early sought, and happily supplied by the genius of Eli Whitney, a native of Worcester county, Massachusetts, under the patronage of the widow of General Greene, of Georgia, and her husband, Mr. Miller. Whitney's saw-gin, patented in March, 1794, was the first cotton-cleaning machine recorded in the United States Patent Office. Its appearance produced intense excitement, and numerous infringements of his patent rights, which involved him in expensive and vexatious lawsuits, and finally drove him into other enterprises, in which his ingenuity achieved reputation and success. In 1796 Whitney and partner had thirty machines in operation in Georgia by animal or water power, and in December, 1801, the legislature of South Carolina purchased the right for that State at a cost of \$50,000, and threw it open to the public. One of the early invasions of the patent was by Hogden Holmes, of Georgia, who also patented a saw-gin in 1796. Two other Georgians the same year took out patents for saw-gins, and in 1803 another was taken for a saw-gin by G. F. Sultonstall, of North Carolina. Among other improvements on gins made by Mr. Carver, before mentioned, who had long experience in their manufacture, was the grate patented by him in 1823, which being placed where the seed is arrested and the fibre taken from it by the saw, prevented clogging, and the delay of cleaning the saw, &c. In 1837 he patented an improvement in ribs for saw-gins. Mr. McCarthy in 1840 connected a vibrating saw to the roller-gin, adapting it for cleaning both green and black seed cotton. This machine it was thought would supersede Whitney's, the fibre cleaned by it having brought three cents per pound more in the Mobile market than that cleaned by the latter.

"The manufacture of cotton-gins has long formed a branch of business in the machine-shops of the northern and middle States, and an independent business in several southern cities. One of the earliest and most extensive of these concerns was that of Samuel Griswold, at Clinton, Georgia. In 1833 the business was commenced in Autauga county, Alabama, by Daniel

## INTRODUCTION.

Pratt, a native of New Hampshire, who had learned the business with Mr. Griswold. He there manufactured cotton-gins of superior quality for the neighboring southwestern States, including many for Texas, and even New Mexico, and acquired reputation and fortune in supplying the great demand, which required a branch house in New Orleans. His large accumulations were employed in erecting saw and planing mills, one of the first flouring-mills in Alabama, grist-mills, large cotton and cotton-gin factories, and other factories and tenements, forming the flourishing village of Prattville, where in 1851 he employed 200 hands, and made annually about 600 gins. He had manufactured since 1833 upwards of 8,000 cotton-gins. In 1846 he received from the University of Alabama the honorary degree of *master in the mechanic arts*, for the intelligent and benevolent exercise of his mechanical ingenuity and ample means.

"We have thus very briefly, as compared with the importance of the subject, given a sketch of the rise and progress of the manufacture and introduction of some of the most important implements connected with husbandry. To some it might seem a subject better discussed in the volume on manufactures; but believing it to be one of special interest to agriculturists, we have not hesitated respecting the propriety of incorporating the facts in a volume prepared especially for the farmers of the country, in whose tastes and progress we feel a deep interest, and whose advantages in late years we can appreciate from experience. We hope we may be pardoned for referring in a public work to our personal experience in stating that, as recently as 1849, when we relieved ourselves of the cultivation of a farm in Pennsylvania to take charge of the census, nearly all the operations of agriculture, except that of threshing the grain, were performed by manual labor; and the number of workmen to be provided for, especially during the period of harvest, rendered several months of the year a season of family solicitude and drudgery. On the same farm the crops of the past year were sown and gathered in a much shorter time, in better condition, with one-fourth the number of laborers—the grain being cut by machinery, and the grass mown, loaded on the wagon, and transferred therefrom to mow by means of mechanical appliances. The effects of such changes upon the character of the rural population of our country will soon manifest themselves by their elevating influences.
